MEMORANDUM

TO: Air Quality Board

THROUGH: Bryce C. Bird, Executive Secretary

FROM: Colleen Delaney, Environmental Scientist

DATE: May 21, 2014

Background

Ozone is created by a photochemical reaction and the main precursors are volatile organic compounds (VOC) and nitrogen oxides (NOx). High ozone levels have been measured in the Uinta Basin during winter temperature inversions when there is snow on the ground, which enhances the chemical reactions that create ozone. Elevated summertime ozone levels occur throughout the state. While summertime ozone is currently below the National Ambient Air Quality Standards (NAAQS), EPA is expected to lower the ozone standard to within the range of 60 – 70 ppb within the next two years. Depending on the level of the standard, a significant portion of Utah may exceed the new NAAQS. See Figure 1.
Oil and gas production is the most significant source of anthropogenic VOC in Utah. In the Uinta Basin, oil and gas production accounts for 97% of anthropogenic VOC emissions.

The State of Utah entered into EPA’s Ozone Advance Program in 2012 with the goal to proactively lower ozone values in the Uinta Basin. As part of that effort, DAQ drafted the four attached rules to establish general operating provisions for the oil and gas industry, establish control requirements that are highly cost-effective, and ensure that existing air pollution control equipment operates effectively. These draft rules were presented at an Oil and Gas Stakeholder public information meeting on July 30, 2013, and have been revised to address stakeholder comments.
General Provisions

The General Provisions rule, R307-501, establishes general requirements for prevention of emissions and use of good air pollution control practices for all oil and gas exploration, production, transmission and distribution operations; well production facilities; natural gas compressor stations; and natural gas processing plants. The rule requires that operating and maintenance procedures are conducted in a manner consistent with good air pollution control practices.

Pneumatic Controllers

Pneumatic controllers powered by pressurized natural gas are used in the oil and gas industry. In the past, high-bleed devices that vent natural gas to the atmosphere were commonly used. The recent oil and gas New Source Performance Standard (NSPS) OOOO requires the use of low-bleed controllers in most circumstances. R307-502 would require the replacement of existing high-bleed devices with low-bleed devices so that all pneumatic controllers in the state would meet the NSPS standard. While there is an initial cost to replace these controllers, there is also a benefit to the operators because the natural gas is recaptured and can be sold as product. EPA’s Natural Gas Star Program estimates a cost of $2,104 to replace an existing high-bleed controller. More recently, Colorado estimated initial costs of $1,420 to replace each high-bleed pneumatic controller. At current natural gas prices the new devices will pay for themselves in about 1½ to 2 years and will then continue to provide on-going savings to the company.

Implementation of this rule is estimated to reduce VOC emissions by 3,716 tons/year in the 5-county area included in the WRAP Phase III inventory for oil and gas (Duchesne, Uintah, Carbon, Emery, and Grand Counties). The draft rule phases in the requirement over several years. High-bleed pneumatic devices in Duchesne and Uintah Counties must be replaced by December 1, 2015 to provide reductions prior to the 2015/2016 winter ozone season. High-bleed pneumatic devices in the rest of the state must be replaced prior to April 1, 2017 to provide reductions prior to the 2017 summer ozone season.

Flares

New or modified oil and gas well production sites are required to capture and control VOC emissions, and the typical control device is a flare. Utah’s proposed General Approval Order (GAO) for a Crude Oil and Natural Gas Well Site and/or Tank Battery requires the VOC control device to reduce VOC emissions by 98%. The proposed GAO requires continuous compliance with this control efficiency standard. Because many well production sites are unmanned, if the wind or a surge of gas blows out the pilot light, it is possible for the combustion device to cease working for an extended period of time until personnel visit the site and relight the pilot light. During its recent rulemaking effort, Colorado estimated that pilot lights were not functioning about 3% of the time, leading to significant uncontrolled VOC emissions. Colorado estimated a cost of $2,348 to retrofit an existing flare with an auto igniter, with an annualized cost of $475. The overall cost effectiveness of the retrofit was $302/ton of VOC reduced.

R307-503 would require all new flares to be equipped with a self-igniter to relight the pilot light if the flame is extinguished. The rule would also require all existing flares in Duchesne and Uintah Counties to be retrofitted with self-igniters by December 1, 2015, to provide reductions prior to the 2015/2016 winter.

ozone season. Flares in the rest of the state must be replaced prior to April 1, 2017, to provide reductions prior to the 2017 summer ozone season.

**Tank Truck Loading**

The proposed General Approval Order for a Crude Oil and Natural Gas Well Site and/or Tank Battery contains a requirement that all tanker trucks loading on-site use either bottom filling or submerged filling to reduce VOC emissions created by splashing of liquids when loading oil, condensate, or produced water. R307-504 would expand this requirement to all existing operations. DAQ estimates that this change could reduce VOC emissions due to tank truck loading by about 59% (1,017 tons/year in the Uinta Basin in 2015). In practice, many trucks are already equipped to meet the requirements established in existing approval orders so the overall benefit will be lower if fewer retrofits are required. The new rule will provide a consistent standard for all operators. Top-loading trucks can be inexpensively retrofitted by installing a pipe at the inlet to ensure that liquids are loaded using submerged fill instead of splash loading.

R307-501-1. Purpose.

R307-501 establishes general requirements for prevention of emissions and use of good air pollution control practices for all oil and gas exploration and production operations, well production facilities, natural gas compressor stations, and natural gas processing plants.

(1) The definitions in 40 CFR 60, Subpart OOOO Standards of Performance for Crude Oil and Natural Gas Production, Transmission and Distribution, which is incorporated by reference in R307-210 apply to R307-501.

(2) “Well production facility” means all equipment at a single stationary source directly associated with one or more oil wells or gas wells. This equipment includes, but is not limited to, equipment used for storage, separation, treating, dehydration, artificial lift, combustion, compression, pumping, metering, monitoring, and flowline.

(1) R307-501 applies to all oil and gas exploration, production, distribution, and transmission operations; well production facilities; natural gas compressor stations; and natural gas processing plants in Utah.

(2) R307-501 does not apply to oil refineries.

(1) General requirements for prevention of emissions and use of good air pollution control practices.

(a) All intermediate hydrocarbon liquids collection, storage, processing and handling operations, regardless of size, shall be designed, operated and maintained so as to minimize emission of volatile organic compounds to the atmosphere to the extent reasonably practicable.

(b) At all times, including periods of start-up, shutdown, and malfunction, the installation and air pollution control equipment shall be maintained and operated in a manner consistent with good air pollution control practices for minimizing emissions.

(c) Determination of whether or not acceptable operating and maintenance procedures are being used will be based on information available to the director, which may include, but is not limited to, monitoring results, infrared camera images, opacity observations, review of operating and maintenance procedures, and inspection of the source.
(2) General requirements for air pollution control equipment.

(a) All air pollution control equipment shall be operated and
maintained pursuant to the manufacturing specifications or equivalent
to the extent practicable and consistent with technological
limitations and good engineering and maintenance practices.

(b) The owner or operator shall keep manufacturer specifications
or equivalent on file.

(c) In addition, all such air pollution control equipment shall
be adequately designed and sized to achieve the control efficiency
rates established in rules or in approval orders issued under R307-401
and to handle reasonably foreseeable fluctuations in emissions of VOCs
during normal operations. Fluctuations in emissions that occur when
the separator dumps into the tank are reasonably foreseeable.

KEY: air pollution, oil, gas,
Date of Enactment or Last Substantive Amendment: 2014
Authorizing, and Implemented or Interpreted Law: 19-2-104(1)(a)

R307-502-1. Purpose.

(1) The purpose of R307-502 is to reduce emissions of volatile organic compounds from pneumatic controllers that are associated with oil and gas operations.

(2) The rule requires existing pneumatic controllers to meet the standards established for new controllers in 40 CFR Part 60, Subpart OOOO.

(1) The definitions in 40 CFR 60, Subpart OOOO Standards of Performance for Crude Oil and Natural Gas Production, Transmission and Distribution, which is incorporated by reference in R307-210 apply to R307-502.

(2) “Existing pneumatic controller” means a pneumatic controller affected facility as described in 40 CFR 60.5365(d)(1) through (3) that was constructed, modified, or reconstructed prior to October 15, 2013.

R307-502 applies to the owner or operator of any existing pneumatic controller in Utah.

(1) Effective December 1, 2015, all existing pneumatic controllers in Duchesne County or Uintah County shall meet the standards established for pneumatic controller affected facilities that are constructed, modified or reconstructed on or after October 15, 2013, as specified in 40 CFR 60, Subpart OOOO Standards of Performance for Crude Oil and Natural Gas Production, Transmission and Distribution.

(2) Effective April 1, 2017 all existing pneumatic controllers in Utah shall meet the standards established for pneumatic controller affected facilities that are constructed, modified or reconstructed on or after October 15, 2013 as specified in 40 CFR 60, Subpart OOOO Standards of Performance for Crude Oil and Natural Gas Production, Transmission and Distribution.

The owner or operator shall identify all existing pneumatic controller facilities that were replaced or retrofitted to meet the requirements of R307-502-4 in the annual report required under 40 CFR 60.5420.

Authorizing, and Implemented or Interpreted Law: 19-2-104(1)(a)

R307-503. Oil and Gas Industry: Flares.

R307-503-1. Purpose.
R307-503 establishes conditions to ensure that combustion devices used in the oil and gas industry are operated effectively.

“Auto igniter” means a device which will automatically attempt to relight the pilot flame in the combustion chamber of a control device in order to combust volatile organic compound emissions.

(1) R307-503 applies to all oil and gas exploration and production operations, well sites, natural gas compressor stations, and natural gas processing plants in Utah.

(2) R307-503 does not apply to oil refineries.

(1) All open or enclosed flares used to control emissions of volatile organic compounds shall be equipped with and operate an auto-igniter as follows:

   (a) All open or enclosed flares installed on or after November 1, 2014, shall be equipped with an operational auto-igniter upon installation of the flare.
   
   (b) All open or enclosed flares installed before November 1, 2014, in Duchesne County or Uintah County shall be equipped with an operational auto-igniter by December 1, 2015, or after the next flare planned shutdown, whichever comes first.
   
   (c) All open or enclosed flares installed before November 1, 2014, in all other areas of Utah shall be equipped with an operational auto-igniter by April 1, 2017, or after the next flare planned shutdown, whichever comes first.

The owner or operator shall maintain records demonstrating the date of installation and manufacturer specifications for each auto-igniter required under R307-503-3.

KEY: air pollution, oil, gas, flares
Date of Enactment or Last Substantive Amendment: 2014
Authorizing, and Implemented or Interpreted Law: 19-2-104(1)(a)

R307-504. Oil and Gas Industry: Tank Truck Loading.

R307-504-1. Purpose.

R307-504 establishes control requirements for the loading of liquids containing volatile organic compounds at oil or gas well sites.

(1) The definitions in 40 CFR 60, Subpart OOOO Standards of Performance for Crude Oil and Natural Gas Production, Transmission and Distribution that is incorporated by reference in R307-210 apply to R307-504.

(2) “Bottom Filling” means the filling of a tank through an inlet at or near the bottom of the tank designed to have the opening covered by the liquid after the pipe normally used to withdraw liquid can no longer withdraw any liquid.

(3) “Submerged Fill Pipe” means any fill pipe with a discharge opening which is entirely submerged when the liquid level is six inches above the bottom of the tank and the pipe normally used to withdraw liquid from the tank can no longer withdraw any liquid.

(4) “Well production facility” means all equipment at a single stationary source directly associated with one or more oil wells or gas wells.

R307-504 applies to any person who loads or permits the loading of any intermediate hydrocarbon liquid or produced water at a well production facility after January 1, 2015.

R307-504-4. Tank Truck Loading Requirements.

Tank trucks used for intermediate hydrocarbon liquid or produced water shall be loaded using bottom filling or a submerged fill pipe.

4th High, Daily Maximum, 8-Hour Ozone Trends

Source: EPA Air Data
Ozone

- **Statewide – Summertime Ozone**
  - EPA expected to propose tighter standard in December 2014
- **Uinta Basin – Wintertime Ozone**
  - Occurs during temperature inversions when there is snow on the ground
  - Extensive research since 2010
    - VOC reductions are most likely to reduce ozone
  - **DAQ focus**
    - Research, emission inventory, modeling development to ensure that ozone formation is understood and strategies are effective
    - **Permitting**
      - Ensure new sources are well controlled
      - Existing sources above permitting thresholds required to have an approval order
    - Emission reductions from existing, legacy equipment that is not well controlled
    - Retrofit rules, first round
      - Cost effective
      - Ensure existing equipment is operating as designed
      - Comments received through stakeholder process prior to proposal
  - Additional retrofit strategies through Ozone Advance Program
Utah Statewide 2011 Annual Anthropogenic VOC Emissions

- Area: 54%
- Non-Road Mobile: 22%
- On-Road Mobile: 11%
- Oil and Gas Area Sources: 10%
- Oil and Gas Nonroad (2013): 3%
Proposed Oil and Gas Rules

• R307-501 General Provisions
  – VOC emissions minimized
  – Equipment must be properly maintained and operated
  – Equipment sized properly

• R307-502 Pneumatic Controllers
  – Accelerate implementation of NSPS standards
  – Replace high-bleed controllers with low-bleed or no-bleed controllers
    • December 1, 2015 in Uinta Basin
    • April 1, 2017 statewide
  – Controllers pay for themselves in 1 1/2 - 2 years in most cases
  – Estimated emission reduction 3,716 tons VOC/yr statewide
Location of Pneumatic Devices at Production Sites

SOV = Shut-off valve (Unit isolation)
LC = Level control (Separator, contactor, flash tank separator, TEG regenerator)
TC = Temperature control (Regenerator fuel gas)
FC = Flow control (TEG circulation, compressor bypass)
PC = Pressure control (FTS pressure, compressor suction/discharge)
Low and No-bleed Pneumatic Valves
Examples of Electric-Actuated Valves
Proposed Oil and Gas Rules

• R307-503 Flares
  – Require all new flares to be equipped with an automatic igniter
  – Require existing flares to be retrofit
    • December 1, 2015 Uinta Basin
    • April 1, 2017 statewide
  – Estimated cost $302/ton VOC reduced

• R307-504 Tank Truck Loading
  – Require bottom filling or submerged pipe filling
Bottom or Submerged Filling

- Condensate, oil, and produced water are collected at many oil or gas well sites.
- Splash loading of tanker trucks churns the liquid, increasing VOC emissions.
- Bottom filling or submerged loading of tank trucks reduces loading loss by about 59% when compared to splash loading (AP-42, page 5.2-4)
  - Inexpensive retrofit
  - Currently required in UDAQ approval orders
