ABSTRACT

This document describes the non-road mobile source emissions inventory modeling procedure and results for the Serious PM_{2.5} SIP episodes.

Non-road mobile sources include 1) non-road engines and motorized equipment from MOVES2014a (formerly the EPA NONROAD Model), 2) aircraft, 3) airport ground support equipment and 4) diesel locomotives. The majority of emissions come from non-road engines and equipment. However, about 40% of non-road NO_x comes from diesel locomotives. except for SO₂, for which the majority of emissions come from aircraft.

The modeling domain for this SIP includes the entire state of Utah and portions of surrounding states. (UDAQ did not create inventories for out-of-state areas in the domain. Instead, the NEI 2011 was used to obtain inventories for these areas.)

Emissions for the non-road sector in the state of Utah were modeled by UDAQ inventory staff.

Three PM_{2.5} episodes were modeled for this SIP. Overall, the coldest episode took place from Saturday, December 7 through Thursday, December 19, 2013 inclusive. The January 2011 episode was the second coldest, and the February 2016 episode was the warmest.

This document includes inventory results for each of the three episodes. Units were converted to tons per year for easy comparison to other source groups—point, area, and on-road mobile.

If one reviews the daily inventories of non-road engines and equipment from MOVES within a single episode, NO_x is highest on the coldest day, while CO and VOC are highest on the warmest day. PM, SO₂ and NH₃ are insensitive to small changes in daily temperature.

ii. Introduction

This inventory includes emissions of carbon monoxide (CO), nitrogen oxides (NOx), PM10 and PM2.5 exhaust, sulfur dioxide (SO2), volatile organic compounds (VOC) and ammonia (NH3) from miscellaneous non-road engines, locomotives and aircraft.

Inventories were computed for three PM2.5 episodes:

- Episode #1: Saturday, January 1 through Wednesday, January 12, 2011 inclusive (12 days);
- Episode #2: Monday, February 1 through Wednesday, February 17, 2016 inclusive (17 days);
- Episode #3: Saturday, December 7 through Thursday, December 19, 2013 inclusive (13 days).

The PM2.5 domain consists of all 29 counties in Utah and portions of Colorado and Wyoming.

UT County Names, FIPs Codes, Abbreviations and Human Population (2010, 2016 and 2020)

 population data.

For most pollutants, the majority of non-road mobile source emissions come from miscellaneous non-road engines. However, emissions of SOx are higher from aircraft and from diesel locomotives than from miscellaneous non-road engines. In addition, about 54% and 40% of non-road NOx comes from (MOVES) miscellaneous non-road vehicles and equipment and locomotives, respectively.

iii. Overview

The purpose of this document is to explain how the non-road mobile source emission inventories were created for the “Serious” PM2.5 SIP episode days:

- Episode #1: Saturday, January 1 through Wednesday, January 12, 2011 inclusive (12 days);
- Episode #2: Monday, February 1 through Wednesday, February 17, 2016 inclusive (17 days);
- Episode #3: Saturday, December 7 through Thursday, December 19, 2013 inclusive (13 days).

Non-road mobile sources include a) non-road vehicles, equipment and engines from the EPA NONROAD Model (now obsolete, replaced by MOVES/NR); b) aircraft; c) airport ground support equipment (GSE) and d) diesel locomotives.

The non-road mobile source inventories for this SIP were modeled by Utah Division of Air Quality (UDAQ), Inventory Section (formerly Mobile Sources and Transportation Section).

The episode day inventories cover the entire state—all 29 counties. In addition, counties outside Utah were included in the PM2.5 SIP domain. The NEI 2011 was used for these counties.

Emissions units for the episode day inventories were the following:

<u>Non-road Sector</u>	<u>Units</u>
Miscellaneous Non-road Vehicles & Equipment (MOVES/NR)	January 2011, February 2016 and December 2013 weekday or weekend days, according to the calendar
Aircraft and Airport Ground Support Equipment	(January emissions) * (365.25/31) = Tons per Year
Diesel Locomotives	2014 Annual Emissions (TPY)

If emissions are not reported in TPY, as was the case for emissions from MOVES, they are converted to TPY before processing in the CAMx air dispersion model. For weekday and weekend days, emissions were converted to TPY as follows:

$$\text{TPY} = (5/7) * \text{Winter Weekday} * 365.25$$

$$\text{TPY} = (2/7) * \text{Winter Wknd Day} * 365.25$$

This is equivalent to the conversion of daily emissions to TPY:

$$\text{TPY} = [(5 * \text{Wkd} + 2 * \text{Wkend}) / 7] * 365.25$$

The CAMX model then converts the ton-per-year inventories into moles per hour for solids and grams per hour for gases.

EPA guidance requires that states create inventories that use the most recent available data for fleet or equipment characterization, fuel parameters and meteorological data.

Agencies involved in discussions or supplying data include:

Bureau of Transportation Statistics/Transtats/Aviation Databases—commercial aircraft
EPA Office of Transportation and Air Quality: Mobile Team (OTAQ)—general questions
Federal Aviation Administration (FAA)—Emissions and Dispersion Modeling System
FAA Airport Master Records—Airport IQ 5010—aircraft activity for small airports-air taxi and general aviation
Railroad companies operating in Utah—annual reports of locomotive fuel consumption by county
Utah Division of Motor Vehicles (UDMV)—snowmobile inventory for Utah
Utah Transit Authority—commuter rail “Front Runner” activity

Emissions from MOVES/NONROAD (Non-road Vehicles, Equipment and Engines)

Features of MOVES versus EPA NONROAD Model

MOVES2014a was used to obtain emission inventories for non-road mobile vehicles and equipment that operate on unpaved roads or other areas but not on paved roads.

MOVES/NR was run for weekdays and weekend days according to the calendar. Emissions were converted to tons per year as shown above.

MOVES models the same non-road categories as the EPA NONROAD model. For exactly identical inputs, MOVES gives the same results as NONROAD.

However, MOVES models additional compounds that NONROAD does not, including:

CH₄, CO₂, NH₃, major mobile HAPs (1,3-butadiene, acetaldehyde, acrolein, benzene, formaldehyde), polycyclic aromatic hydrocarbons (PAH), various toxic metals, dioxins and furans.

MOVES Inputs for Non-road Mobile Sources

Using MOVES, inputs of fuel (diesel, gasoline, CNG and LPG) and their properties such as ethanol (E-10) volume percent, E-10 market share, E-10 oxygen weight percent, gasoline RVP and fuel sulfur content are supplied from the main MOVES database, movesdb20161117.

Other inputs include temperature and relative humidity data.

The user must use caution to insure that the MOVES default values for such inputs as fuels and temperatures are appropriate. For example, MOVES default temperatures are generally too low for Utah compared to actual temperatures recorded during the past 20 years (1997 – 2016).

Utah obtains meteorological data from one of several reputable websites generally run by colleges and universities in Utah, or from national meteorological websites such as National Climatic Data Center (NCDC) or Western Regional Climate Center (WRCC).

Meteorological data for this inventory came from MESOWEST operated by the University of Utah Department of Atmospheric Sciences (<http://mesowest.utah.edu/>). (1)

Aircraft Emissions

Commercial aircraft activity (mostly at Salt Lake City International Airport, but also at other major airports in Utah, including Ogden, Provo, St. George, Cedar City and Wendover), was obtained from Transtats/Bureau of Transportation Statistics (<https://www.transtats.bts.gov/>). Activity data is available for any given historical month, but not for specific days. (2)

The aircraft portion of the inventory includes aircraft and helicopter emissions from all the major and minor airports operating in Utah. The Federal Aviation Administration (FAA) Emissions and Dispersion Modeling System software (EDMS 5.1.4.1) was used to obtain emission factors for aircraft.

In addition to commercial aircraft, the aircraft inventory includes air taxi (mostly privately owned or operated small aircraft), general aviation (small aircraft based at small municipal airports in Utah) and military aircraft. Activity for these aircraft categories comes from the FAA Airport Master Records, found at <http://www.grc1.com/5010web>.

Only three airports are considered major point sources: Salt Lake City International and the military installations Hill Air Force Base in Davis County and Dugway Proving Ground in Tooele County. The vast majority of aircraft emissions in Utah comes from Salt Lake City International.

Aircraft produce significant amounts of CO and SO_x. In fact, the majority of SO_x in the non-road inventory comes from aircraft.

Airport Ground Support Equipment

Airport Ground Support Equipment (GSE) emissions are included in output from EDMS. UDAQ believes the emission factors from EDMS are more accurate than those from the MOVES/NR model. Therefore, MOVES emissions for GSE were removed from the MOVES output to avoid double-counting with EDMS.

Locomotive Emissions

There are six railroad companies operating in Utah. The vast majority of emissions come from Union Pacific Railroad, which operates in seventeen of the 29 counties in Utah.

Locomotives produce significant amounts of NO_x and minor amounts of other pollutants.

Diesel locomotive fuel consumption was reported by the railroads operating in Utah. These reports show annual fuel consumption. Some railroads also report ton-miles by county (Union Pacific Railroad) or miles of track for a round trip, such as reported by AMTRAK and the Utah Transit Authority “Front Runner” commuter rail. Emissions are calculated based on annual diesel fuel consumption.

Federal regulations (Tier IV Non-road Final Rule) require that diesel locomotives operate on ULSD (15 ppm) by 2012. All railroads operating in Utah during 2014 used 15-ppm sulfur diesel except that Salt Lake, Garfield & Western Railway did not return our calls (the latter is an extremely small railroad). For SL, Garfield & Western, diesel sulfur was set to the maximum value of 500 ppm.

See Federal Register and rule text at <https://www.gpo.gov/fdsys/pkg/FR-2004-06-29/pdf/04-11293.pdf> .

Final Comments

PM₁₀ and PM_{2.5} shown above do not include fugitive dust from unpaved roads, which is an Area Source category.

Aircraft emissions from Salt Lake City International Airport are included in the non-road inventory because the point source inventory for SLC Int’l does not include these.

Airport ground support equipment (GSE) emissions from two military bases—Dugway Proving Ground and Hill Air Force Base—are reported in the Point Source inventory. GSE emissions from all other sources are included in this non-road inventory.

iv Emission Inventories

A. Episode Inventories

Three episodes were modeled in this inventory:

Saturday, Jan 1 – Wednesday, Jan 12, 2011 inclusive

Monday, Feb 1 – Wednesday, Feb 17, 2016 inclusive

Saturday, Dec 7 – Thursday, Dec 19, 2013 inclusive

MOVES2014 was run for each separate episode day for each of the 29 counties in Utah. Each episode day was modeled as either a weekday or weekend day according to the calendar.

Commercial aircraft were modeled on a monthly scale (Jan 2011, Feb 2016 and Dec 2013) because landing and takeoff (LTO) data is only available by month or year from the U.S. Department of Transportation “Transtats” website. The monthly inventory was converted to tons per year. Air taxi, general aviation and military aircraft inventories were modeled on an annual scale because LTO data is only available for whole calendar years (from FAA).

Airport ground support equipment was modeled alongside each aircraft make and model using the Emissions and Dispersion Modeling System (EDMS) Software (v. 5.1.4.1).

Diesel locomotives were modeled on an annual scale because reports from railroads show diesel fuel consumption for whole years only.

B. Annual Ton-per-Year Summaries

To easily compare emissions from the various sectors and sources, ton-per-year inventories were modeled and summarized.

For the summary tables in the Appendix, MOVES was run for a “peak winter day” by modeling the coldest day in each county during each episode and creating daily inventories. Daily inventories were multiplied by 365.25 to obtain units of tons per year.

Aircraft and locomotive inventories are reported in tons per year as well.

The summary tables include emissions for the following:

Miscellaneous Non-road Engines and Equipment (MOVES2014)

Aircraft

Aircraft Ground Support Equipment

Locomotives

Total Non-road Mobile Source Emissions

C. Comparison of Coldest and Warmest Episode Days—Ton-per-Year Changes in Inventory

In addition, the *warmest* episode day in each of the 29 counties was modeled to observe the effect of temperature on the inventory of miscellaneous non-road equipment and engines (aircraft and locomotive emissions were modeled on monthly and annual scales, respectively, so these inventories were constant during each day of a given episode).

CO and VOC emissions from nonroad vehicles and equipment in MOVES increase with temperature, while NO_x decreases as temperature increases.

For example, the inventories for Salt Lake County on January 1, 2011 (the coldest day) and on January 8, 2011 (the warmest day) are shown below:

Coldest Episode Day

Date: Saturday, Jan 1, 2011

Min, Max and 24-Hour Average Temperatures (F) 6.7 19.9 13.3

County	CO TONS PER YEAR	NOx PER YEAR	PM10	PM2.5	SO2	VOC	NH3
Salt Lake	25,319	3,023	270.3	258.7	7.420	2,149	3.484

Warmest Episode Day

Date: Saturday, Jan 8, 2011

Min, Max and 24-Hour Average Temperatures (F) 19.0 25.0 22.0

County	CO TONS PER YEAR	NOx PER YEAR	PM10	PM2.5	SO2	VOC	NH3
Salt Lake	25,561	2,995	270.3	258.7	7.420	2,151	3.484

v. Non-road Emissions Sources and Models

- A. Miscellaneous Engines & Equipment EPA MOVES2014a Model (October 2015)

- B. Aircraft (emissions per landing/
takeoff cycle or LTO) Federal Aviation Administration “Emissions and
Dispersion Modeling System” (EDMS), version
5.1.4.1
 - 1. Air Carriers (Commercial) Bureau of Transportation Statistics (BTS)
Transtats” website (2):

Union Pacific Railroad (includes activity from
Burlington Northern Santa Fe)
Utah Railway Company
Utah Transit Authority (commuter rail): diesel fuel
consumption by county and locomotive type: line-
haul, yard and commuter

vi Non-road Miscellaneous Engines and Equipment (MOVES2014a)

The EPA MOVES2014a Model (October 2015) was used to compute non-road emissions.

The current version of MOVES produces identical non-road emissions to those from the EPA NONROAD Model if inputs are the same.

“MOVES” calculates emissions for twelve non-road categories:

Agricultural Equipment
Airport Ground Support Equipment
Commercial Equipment
Construction Equipment
Industrial Equipment
Lawn & Garden Equipment
Logging Equipment
Oil Field Miscellaneous Equipment
Pleasure Craft
Railroad Miscellaneous Equipment
Recreational Equipment
Underground Mining Equipment

Commercial marine equipment, locomotives, and aircraft are not modeled by MOVES2014a (small personal watercraft are included).

MOVES output includes the usual pollutants carbon monoxide (CO), nitrogen oxides (NO_x), PM₁₀ and PM_{2.5} exhaust, sulfur dioxide (SO₂), volatile organic compounds (VOC) and ammonia (NH₃).

In addition, a large number of Hazardous Air Pollutants (HAPs) can be modeled.

For this SIP, the Air Modeling Section requested that Total Organic Gases (TOG), benzene, toluene and xylene also be modeled for analysis by the CAMx air dispersion model. Emissions for these pollutants and compounds are not reported in this document.

The model can output emissions by category and equipment type, fuel and engine type (e.g., 2-stroke and 4-stroke gasoline, diesel, CNG and LPG, including horsepower rating and SCC code).

For each episode, emissions were computed for each separate episode day as either a winter weekday or a winter weekend day. Output units were grams per winter weekday or grams per winter weekend day. Output was organized into “SMOKE” format and transferred to the CAMx

air dispersion model for analysis of pollutant concentrations.

In addition, the coldest episode day in each county was modeled, and output was converted to units of tons per year so comparisons of the inventory between counties and calendar years could easily be made. NOx emissions increase as temperature decreases, while CO and VOC increase with temperature. In the non-road module of MOVES, emissions of PM10 and PM2.5 exhaust, NH3 and SO2 are generally insensitive to small temperature changes. For the PM problem along the Wasatch Front, it is believed that PM, NOx and VOC are the most important pollutants.

However, NONROAD emissions are sensitive to the choice of weekday versus weekend day. Annual average emissions were calculated by the following equation:

$$\text{Annual avg emissions (TPY)} = [(\text{average weekday} * 5 + \text{average weekend days} * 2) / 7] * 365.25$$

A. Input Data

Unlike the EPA NONROAD Model, it is not necessary to manually input fuel parameters such as RVP, ethanol content, sulfur content, etc. Instead, the GUI selections automatically choose the correct fuel parameters from the default database based on the county, years, months and days modeled.

The user must use caution to insure that the MOVES default values for such inputs as fuels and temperatures are appropriate. UDAQ reviewed all data used from the MOVES default database to insure that inputs were correct.

For example, MOVES default temperatures are generally too low for Utah compared to actual temperatures recorded during the past 20 years (1997 – 2016).

Therefore, hourly temperature data by episode day and county were gathered from the University of Utah Department of Atmospheric Sciences “MESOWEST” meteorological website and were input into the model instead of using default meteorological data in the “zonemonthhour” table (<http://mesowest.utah.edu/>). (1)

B. Hourly Temperatures by Episode Day and County

January 1 - 12, 2011 Episode

FIPs	County Name	Coldest Day	24-Hr Min T (F)	24-Hr Max T (F)	Warmest Day	24-Hr Min T (F)	24-Hr Max T (F)
49003	Box Elder	010411	-4.60	12.70	010811	6.50	21.70
49005	Cache	010401	-4.60	12.70	010811	6.50	21.70

49057	Weber	120913	3.9	18.4	121913	26.1	33.1

C. Snowmobile Adjustments (MOVES2014a)

As previously mentioned, MOVES2014a computes identical emissions to those from the EPA NONROAD Model if inputs are the same.

The discussion below sometimes refers to the EPA NONROAD Model because this model was in use when the underlying database for snowmobiles was adjusted to match local survey data.

In MOVES2014a, a folder named “nrsnowmobilefiles” was added to the MySQL data folder to store changes made to the default snowmobile tables.

The following tables were created to store local data for snowmobiles, which replaces default data:

Nrstatesurrogate
 Nrbaseyearequippopulation
 Nrgrowthindex
 Nrmonthallocation

UDAQ reviewed the PM2.5 SIP inventories from the EPA NONROAD model for the 2008 base year and projection years 2014, 2017 and 2019. This showed that, in several counties, a large majority of VOC emissions from equipment in the NONROAD model were emitted by snowmobiles, as shown below:

Calendar Year	County	FIPs	VOC from Snowmobiles (Tons per Win Wkdy)	VOC from NR Model (Tons per Win Wkdy)	Percent from Snowmobiles (%)
2008	Cache	49005	0.262	0.617	42.5
2008	Duchesne	49013	1.085	1.243	87.3
2008	Morgan	49029	2.186	2.206	99.1
2008	Rich	49033	8.290	8.437	98.3
2008	Summit	49043	0.502	0.788	63.7
2008	Wasatch	49051	0.955	1.026	90.2

At the same time, other counties in the domain showed zero VOC emissions from snowmobiles in the EPA NONROAD model.

1. Reallocation of Snowmobile Counts in NONROAD Database (File “nrstatesurrogate”)

Questioning the accuracy of the output, UDAQ obtained recent survey data on snowmobile activity from two agencies. The survey data showed that the true number of snowmobiles by county were very different from the allocation in the NONROAD database. (4, 5)

Therefore, snowmobile counts were reallocated among the counties based on survey data. This was done by modifying the file “nrstatesurrogate” found in the database “movesdb20151028”. For details of changes to the file “nrstatesurrogate”, see the Appendix.

2. Utah Snowmobile Population Changed in MOVES2014a Database (File “nrbaseyearequippopulation”)

The NONROAD file “nrbaseyearequippopulation” shows the default number of snowmobiles in Utah as of calendar year 1999.

UDAQ obtained counts of registered snowmobiles by county from the Utah Tax Commission for calendar years 2008 through 2014. (6)

From the above data, the Utah snowmobile population for calendar year 1999 was estimated. From Tax Commission data, it was found that Utah had about 36,100 snowmobiles in 1999. The default value in the NR file “nrbaseyearequippopulation” showed only 25,729 snowmobiles in Utah.

Therefore, the counts of snowmobiles in the “nrbaseyearequippopulation” file were changed.

Details of changes to this file are shown in the Appendix.

3. Utah Snowmobile Counts in Future Years Changed in MOVES2014a Database (File “nrgrowthindex”)

The NR file “nrgrowthindex” determines counts of equipment in future years.

Because the snowmobile count in the base year (1999) was changed in the NR model, it was necessary to adjust snowmobile counts in future years. This was done by changing the growth numbers in the “nrgrowthindex” file.

Details of changes to the “nrgrowthindex” file are shown in the appendix.

4. Snowmobile Seasonality Changed in MOVES2014a Database (File “nrmonthallocation”)

The NR default file “nrmonthallocation” shows that snowmobile occurs evenly over the months of January, February and December, as denoted by the values (0.333, 0.333, 0.333).

Snowmobile surveys showed that actual activity in Utah is spread evenly over the months from December through April.

Therefore, the “nrmonthallocation” values were changed to (0.200, 0.200, 0.200, 0.200 and 0.200) for the respective months of December through April.

In summary, default values in the following files must be changed for snowmobiles:

File Name	Description
nrstatesurrogate	Relative number of snowmobiles by county in calendar year 2002
nrbaseyearequippopulation	Snowmobile counts by county and source type ID: source type IDs for snowmobiles include: 1002 – 1010
nrgrowthindex	Snowmobiles have growth pattern ID = 98.
nrmonthallocation	Relative snowmobile activity by month

5. Additional MOVES2014a Files Related to Snowmobiles

In addition to changing the default values in the above tables affecting snowmobiles, the following files contain information relevant to snowmobiles, but default values need not be changed. These files help identify source type, growth pattern, and surrogate IDs for snowmobiles.

File Name	Description
nrsorceusetype	Source type IDs by SCC and HP range: snowmobiles are

identified as source type IDs 1002 – 1010.

nrgrowthpattern

Growth pattern ID = 98 identifies snowmobiles

nrsurrogate

Surrogate ID = 14 identifies residential snowmobiles

6. No Additional Changes to the MOVES2014a Database

No other changes were made to the MOVES2014a default database.

vii Aircraft

The aircraft source category includes all aircraft types used for public, private, and military purposes. Aircraft emissions inventories are grouped by type of operation rather than aircraft type. Four types of aircraft activity are included: commercial, air taxi, general aviation and military aircraft.

A. Four Main Operation Types for Aircraft

<u>Operation Type</u>	<u>Description</u>	<u>Source of Emission Factors</u>	<u>SCC Code Groups</u>
Commercial Flights/Air Carriers	Operations at Salt Lake City International Airport and smaller municipal airports.	EDMS and EPA guidance documents for PM from commercial aircraft	2275000000
Air Taxi	Small privately-owned commuter planes	EDMS and EPA guidance documents for air taxi	2275000000
General Aviation Based Aircraft	Small municipal airport operations (aircraft are "based" in small cities and towns)	EDMS and EPA guidance documents for general aviation	2275000000
Military Aircraft	Military operations	Military installations and EPA guidance	2275000000

B. Aircraft Activity (Landings and Takeoffs, or LTOs)

For each type of aircraft operation shown above, the first step is to gather the numbers of landings and takeoffs during the relevant time period.

One common error is to count each landing or takeoff as a complete LTO. This is *incorrect*. Instead, one LTO cycle consists of one landing and one takeoff, so care must be taken to observe

how aircraft activity is reported. In short, activity from the U.S. DOT BTS “Transtats” website reports commercial activity as separate landings and takeoffs, so the total number of these must be divided by two to obtain LTOs. FAA also reports activity as separate landings and takeoffs. The EDMS emission model assumes that the input is in LTO units.

For air taxis, general aviation, and military aircraft, only annual activity data are available. Annual activity is reported by the FAA on its “Airport Master Records”. These records are updated periodically. Some of the airport records have not been updated since 2010, while others are current to December 31, 2015. For those records that are not up-to-date, FAA scaling factors were used to adjust the number of LTOs to the calendar years being modeled (2011, 2016 and 2013). (7)

C. Aircraft Types

1. Commercial

Commercial activity from the U.S. DOT “Transtats” website reports landings and takeoffs by aircraft type using a unique 3-digit code for each aircraft type.

Commercial aircraft landings and takeoffs can be downloaded from the Bureau of Transportation Statistics (BTS) “Transtats” website at <http://www.transtats.bts.gov/> as follows:

Under “Aviation”, one chooses “Air Carrier Statistics - Form 41 Traffic - All Carriers”, and then “T-100 Domestic Segment—All Carriers”. Next, choose “T-100 Domestic Segment (U.S. Carriers)”. In the lower right-hand corner of the box, click on “Download”. At the top of the screen, under “Download Instructions”, choose the state, calendar year and month. For this SIP, calendar years and months were January 2011, December 2013, and February 2016. In addition to the boxes already checked, put a check mark in front of the following parameters:

Aircraft Type
Origin City Name
Destination City Name
Departures Performed

Each “departure performed” is either an arrival or a departure. One landing-takeoff cycle (LTO) consists of one departure and one arrival pair. There were 9,614 LTO cycles that took place in January 2011 where the origin or destination was in Utah.

The vast majority of commercial aircraft activity in Utah takes place at Salt Lake City International Airport. There are about 50 additional smaller municipal airports in the state, but only about ten municipal airports handle commercial aircraft. Based on January 2011 activity, there were about 113,000 commercial LTOs in Utah during the entire 2011 calendar year.

2. Air Taxi and General Aviation

The Utah Department of Transportation, Division of Aeronautics, no longer reports aircraft activity for air taxi and general aviation operations. Instead, activity is reported on FAA “Airport Master Records” for each separate airport in Utah at <http://www.gcr1.com/5010web/>.

As with commercial aircraft, these records report separate landings and takeoffs, so the total must be divided by two to obtain the number of LTOs.

For General Aviation, the Airport Master Record shows, for each airport, the number of based aircraft of each general type: single-engine, multi-engine, and jets. Single- and multi-engine aircraft operate on aviation fuel, which is similar to gasoline, while jets operate on jet fuel. Aircraft refueling emissions are reported in the Area Source inventory.

The Utah Division of Aeronautics was consulted to determine the specific aircraft types used under each general aircraft type—single- and multi-engine and jets.

For Air Taxi, the Airport Master Record for each airport shows the number of landings and takeoffs. The Utah Division of Aeronautics was consulted to determine the specific aircraft types used for air taxis.

3. Military

There are only two major military airports in Utah, each of which sends annual reports of aircraft activity and the inventory to UDAQ:

Hill Air Force Base (Davis County)
Dugway Proving Ground (Tooele County)

However, the Airport Master Records show that about seven small municipal airports have military aircraft activity.

Statewide Aircraft LTOs by Calendar Year, Month and Operational Type (Annualized to LTOs per Year)

<u>Calendar Year and Month</u>	<u>Commercial Monthly LTOs</u>	<u>Commercial Annual LTOs*</u>	<u>Air Taxi</u>	<u>General Aviation</u>	<u>Military</u>	<u>SUM</u>
Jan 2011	9,614	113,275	61,752	252,108	22,353	449,488
Feb 2016	9,698	114,264	49,013	390,463	25,195	578,935
Dec 2013	9,750	114,877	73,637	328,892	29,859	547,265

*Annual commercial LTOs were obtained by multiplying monthly LTOs by (365.25/31).

D. Emissions and Dispersion Modeling System (EDMS) Software

The EDMS model (v. 5.1.4.1) was used to obtain emissions from the numerous aircraft types in the inventory.

The user enters the calendar year and name of airport. A list of all the aircraft and engine types opens, and the user selects the specific aircraft type (and engine type if known—otherwise, the default engine type for the aircraft type is chosen). Then, the number of LTOs (separate landings and takeoffs divided by two) is entered. The entire list of aircraft and engine types operating at a particular airport is entered. The user then merely chooses “Update”, and the inventory is generated in the units chosen by the user.

Sensitivity tests showed that the location of the airport has almost no effect on emissions, so Salt Lake City International Airport was selected as the default location.

Emissions reported include CO, NOX, PM10 and PM2.5 exhaust, SO2 and VOC, but not NH3.

NEI 2014 Aircraft Inventory and Activity Scaling Factors to Calendar Years 2011, 2013 and 2016

EDMS 5.1.4.1 was run for the NEI 2014 for all 29 counties. Sensitivity tests showed that the emission factors did not change for a given aircraft and engine type when the calendar year was changed. Therefore, to obtain emissions for 2011, 2013 and 2016, FAA scaling factors were used to adjust the aircraft activity to the calendar year needed. Scaling factors are shown in the FAA Appendix item “Total Combined Aircraft Operations at Airports”, Table 32 (shows activity for historical years 2007 – 2015, and projected activity for calendar years 2015 – 2035. (7)

E. Airport Ground Support Equipment (GSE)

Aircraft ground support emissions (GSE) are generated from the EDMS 5.1.41 model at the same time that aircraft tailpipe emissions are generated.

For example, when a particular aircraft type is modeled in EDMS, the number of landing and takeoff (LTO) cycles is input. The model automatically generates, in addition to aircraft emissions, ground support equipment emissions from this activity.

GSE emissions from two point sources—Hill Air Force Base and Dugway Proving Ground—are reported in the Point Source inventories from these sources. GSE emissions from these sources will not be modeled by UDAQ using EDMS. Care will be taken that these emissions are not double-counted.

viii. Diesel Locomotives

The locomotive source category includes railroad locomotives powered by diesel-electric

engines and does not include locomotives powered by electricity or steam.

All of the criteria pollutants, VOC, CO, NO_x, SO_x, PM₁₀, PM_{2.5} and NH₃ are included in the locomotive inventory. Emissions were estimated by applying emission factors to the total amount of diesel fuel used by locomotives. Emission factors for the criteria pollutants were obtained from the EPA guidance document “Emission Factors for Locomotives” (April 2009). (8)

For NH₃, the EPA document “Documentation for Locomotive Component of the National Emissions Inventory Methodology” (May 2011) was used. (9)

About 90% of locomotive emissions come from Union Pacific Railroad. The second-highest source of locomotive emissions is the Utah Transit Authority commuter rail, the “Front Runner”. Commuter rail currently runs from Ogden in the north (Weber County to Provo in the south (Utah County).

The sulfur content of locomotive diesel fuel affects emissions. UDAQ requested railroad companies to report the sulfur content of diesel fuel along with the volume of fuel used.

Diesel locomotives are grouped by two operations: line haul and yard, or switch.

Emissions from diesel locomotives were reported to UDAQ by the individual railroad companies that operate in Utah. For 2011 and 2014, these companies include Amtrak, Burlington Northern Santa Fe Railway (BNSF), Salt Lake, Garfield & Western Railway, Union Pacific Railroad Company (UPRR), Utah Railway and Utah Transit Authority (UTA)--commuter rail operations.

To estimate diesel fuel consumption for the 2013 and 2016 episodes, scaling factors were applied.

For projections of commuter/passenger diesel fuel consumption, scaling factors were obtained from an AMTRAK report, “AMTRAK Fleet Strategy, v. 3.1”. Passenger growth was projected at 2% per year. Thus diesel fuel consumption was projected to increase 2% per year as well. (10)

For projections of freight diesel fuel consumption, scaling factors were obtained from the report by U.S. DOE, Energy Efficiency & Renewable Energy, “Freight Transportation Demand: Energy-Efficient Scenarios for a Low-Carbon Future”, 2012. Line-haul diesel fuel consumption was projected by using projections of ton-miles of freight through 2030. (11)

ix Output

A. MOVES2014a

In order to capture the day-to-day emissions profile of the non-road inventory, MOVES was run for each of the 29 counties in Utah for each separate episode day. For example, the first episode ran from Saturday, January 1 through Wednesday, January 12, 2011. Saturdays and Sundays

were modeled separately as January weekend days, and Monday through Fridays were modeled separately as January weekdays. Hourly temperature and relative humidity data were input into the model to reflect actual meteorology.

The resulting output in units of grams per January weekday or weekend day were compatible for input into the CAMX air dispersion model.

B. Aircraft (EDMS v. 5.1.4.1)

Commercial aircraft activity (landings and takeoffs, or LTOs) were downloaded for the month and calendar year of each episode. Daily LTO activity for commercial aircraft is not available on the U.S. DOT Bureau of Transportation Statistics (BTS) "Transtats" website, so monthly activity was captured.

For air taxi, general aviation and military aircraft LTOs, only annual data is available from FAA.

Thus the aircraft portion of the inventory is reported in units of tons per year, where the January inventory for commercial aircraft use the conversion factor of (365.25/31) to obtain TPY from January tons.

The final aircraft inventory is reported in tons per year.

Aircraft GSE emissions were also reported in tons per year.

C. Diesel Locomotives

Reports submitted by railroads included diesel fuel consumed by locomotives by county. Emissions were computed by applying EPA emission factors in units of grams per gallon consumed.

Locomotive diesel fuel consumption was reported on an annual scale only, so the units of locomotive emissions are tons per year.

Union Pacific Railroad is by far the largest railroad operating in Utah.

x. APPENDIX ITEMS

1. January 2011 Non-road Mobile Source Inventory Summaries

a. Miscellaneous Non-road Engines and Equipment from MOVES2014a (formerly EPA NONROAD Model)

2011 Tons per Year Based on January 2011 Episode

B. MOVES2014a Model: Changes to Underlying Database for Snowmobiles

The following files in the MOVES2014a database were changed, as discussed in the body of the

report:

1. File Name: "nrstatesurrogate"

Counts show the relative numbers of snowmobiles by county.

Surrogate ID	County ID	Surrogate Year ID	Original Count	Revised Count	
14	49000	2002	1,891	1,891	UT
14	49001	2002	0	0	Beaver
14	49003	2002	0	0	Box Elder

14	49057	2002	0	226	Weber

2. File Name: "nrbaseyearequippopulation"

Based on estimated snowmobile counts obtained from the Utah Tax Commission for calendar year 1999, the populations of snowmobiles were adjusted upwards as follows:

FIPS	Year	Source Type ID	Equipment Description	HP Min	HP Max	Original Population	Revised Population
49000	1999	1002	2-Str Snowm	1	3	103.4	145.1
49000	1999	1003	2-Str Snowm	3	6	61.0	85.6
49000	1999	1004	2-Str Snowm	11	16	65.6	91.9
49000	1999	1005	2-Str Snowm	16	25	5,219.0	7,322.7
49000	1999	1006	2-Str Snowm	25	40	5,268.0	7,391.5
49000	1999	1007	2-Str Snowm	40	50	2,364.8	3,318.0
49000	1999	1008	2-Str Snowm	50	75	8,331.3	11,689.6
49000	1999	1009	2-Str Snowm	75	100	3,424.1	4,804.3
49000	1999	1010	2-Str Snowm	100	175	892.0	1,251.6

SUM

25,729.1

36.100.0

3. File Name: nrgrowthindex

The 1999 base year population of snowmobiles in Utah was changed. Therefore, snowmobile growth factors in future years were also changed.

However, data from Utah Tax Commission showed snowmobile counts actually decreased over calendar years 2005 through 2014. Therefore, growth factors also decrease over calendar years as follows:

Snowmobile Indicator Code: 098

SCC: 226001020

Type: 2-Stroke Snowmobile

Calendar Year	Growth Pattern ID	Original Growth Indicator Value	Revised Growth Indicator Value	Utah Actual Snowmobile Counts
1970	98	500	500	
1990	"	1,000	353	
1996	"	1,000	309	
1997	"	1,063	302	
1998	"	1,121	294	
1999	"	1,172	287

4. File Name: nrmonthallocation

In the default file, fractions of annual activity by month were changed for snowmobiles (SCC = 2260001020) as follows:

State	SCC	Equipment Description	Jan	Feb	Mar	Apr	Dec
49000	2260001020	Snowmobiles	0.200	0.200	0.200	0.200	0.200

(Fractions for all other months are zero.)

xi Footnotes

1. University of Utah “MESOWEST” website (<http://mesowest.utah.edu/>)
2. U.S. Department of Transportation “Transtats” website, <http://www.transtats.bts.gov/>

Under “Aviation”, one chooses “Air Carrier Statistics - Form 41 Traffic - All Carriers”, and then “T-100 Domestic Segment—All Carriers”. Next, choose “T-100 Domestic Segment (U.S. Carriers)”. In the lower right-hand corner of the box, click on “Download”. At the top of the screen, under “Download Instructions”, choose the state, calendar year and month. In addition to the boxes already checked, put a check mark in front of the following parameters:

Aircraft Type
 Origin City Name
 Destination City Name
 Departures Performed

7. Aircraft Activity Scaling Factors
http://www.faa.gov/data_research/aviation/aerospace_forecasts/

The scaling factors are found in the EXCEL document under the bold heading “FY 2015-2035 Forecast Tables”, (choose General Aviation A (Tables 28 – 31, MS EXCEL). Note there are two

sets of tables that use the same name, “General Aviation Tables 28 – 31”. Choose the second one, which actually contains Tables 32 – 34.
