1.0 Introduction

The safe storage and disposal of depleted uranium (DU) waste is essential for mitigating releases of radioactive materials and reducing exposures to humans and the environment. Currently, a radioactive waste facility located in Clive, Utah (the "Clive facility") operated by Energy Solutions is proposed to receive and store DU waste that has been declared surplus from radiological facilities across the nation. The Clive facility has been tasked with disposing of the DU waste in an economically feasible manner that protects humans from radiological releases.

To assess whether that the proposed Clive facility DU disposal location and containment technologies are suitable for protection of human health, specific performance objectives for land disposal of radioactive waste set forth in Title 10 Code of Federal Regulations Part 61 (10 CFR 61) Subpart C, promulgated by the U.S. Nuclear Regulatory Commission (NRC), must be met. In order to support the required radiological performance assessment (PA), a detailed computer model is being developed to evaluate the potential detrimental effects on human health that would result from the disposal of DU and its associated radioactive contaminants.

A key activity in developing a PA for a radiological waste repository is the comprehensive identification of relevant external factors that should be included in quantitative analyses. These factors, termed "features, events, and processes" (FEPs), form the basis for scenarios that are evaluated to assess site performance.

Although it is not a governing regulation for the disposal of LLW and DU at Clive, Title 40 CFR Part 191, promulgated by the U.S. Environmental Protection Agency (EPA), provides a useful and general definition for the scope of a PA analysis of a radiological disposal facility. The PA 1) identifies the processes and events that might affect the disposal system, 2) examines the effects of these processes and events on the performance of the disposal system, and 3) estimates the cumulative releases of radionuclides considering the associated uncertainties caused by all significant processes and events (40 CFR 191). The identification of FEPs is essential to the development of the conceptual site model (CSM) and model scenario development process (see *Conceptual Site Model for Disposal of Depleted Uranium at the Clive Facility* white paper).

This report serves to document and examine the universe of FEPs that may apply to the disposal of depleted uranium (DU) waste at the Clive Facility. FEPs that are screened and identified as relevant for the Clive facility PA are identified in this white paper and are further elaborated in the CSM documentwhite paper.

This document is considered to be a living document that is synchronized with current conceptual models, analysis, and modeling of the PA. As concepts and modeling evolve, so too will this document.

2.0 Identification of Features, Events, and Processes

The identification of FEPs for use in the Clive facility PA-DU PA Model was an iterative process that began with compiling an exhaustive list of candidate FEPs that could affect the long-term

Formatted: Font: Not Italic

performance of the radiological waste repository. As an initial step, all potentially relevant FEPs from a variety of reference sources were collected. The initial list from external sources was modified as additional FEPs were identified that are specific to the Clive facility.

This exhaustive initial compilation of FEPs led to significant redundancy across the original sources. Redundancy was addressed by the modification of the candidate list of FEPs through normalization (removal of redundant FEPs) and assignment of FEPs categories (grouping of common FEPs). This section describes the FEP identification process, including implementation of the normalization, categorization and screening processes.

2.1 Compilation of FEPs

The initial list of FEPs pertaining to the efficacy of disposal of radioactive wastes in general was compiled from several scenario development documents published for other nuclear waste disposal facilities, including those for Yucca Mountain Project, the Waste Isolation Pilot Plant, and several foreign radioactive waste projects. The primary literature source for FEP analysis is Guzowski and Newman (1993). They compiled over 700 potentially disruptive FEPs from a review of scenario documentation from other waste repositories around the world.

The facilities considered in Guzowski and Newman have substantially different geological, environmental and regulatory settings from those of the Clive facility. Consequently, the collection of FEPs in Guzowski and Newman provides a substantial list that should be considered for any PA, but they are also missing FEPs that pertain more particularly to the waste disposal facility at Clive. Site-specific understanding of the environmental and engineered attributes of the Clive facility, and the potentially affected region and population, was used to augment the initial compilation of FEPs.

Additional FEPs were also identified from the Nuclear Energy Agency database (NEA, 2000). In this initial compilation step, nearly 1,000 FEPs were identified from the literature and site-specific considerations. Initial FEPs compiled from all sources are listed in Table 1 in the Appendix.

2.2 Normalization and Consolidation of FEPs

Subsequent to the initial compilation of FEPs, steps were taken to reduce redundancy. Initially, FEPs were sorted alphabetically and duplicates were deleted. Recorded FEP values that were different only in vernacular/diction (e.g., "climate change" versus "change in climate") were normalized to capture a single primary FEP value for a series of identical or closely-related concepts.

To address duplication of FEPs where similar terminology was stated dissimilarly, initial FEPs were grouped by keyword content (e.g., "climate," "waste," "groundwater," etc.) and evaluated for possible normalization or consolidation. Where possible, FEPs were normalized to a standard terminology.

Similar but not identical FEPs were maintained, to be evaluated as part of the consolidation step. At this point, each FEP was considered for its similarity to other FEPs, so that they could be grouped into fewer classes, making the list more manageable. For example, all geochemical processes were grouped together. These would be easier to address as a group for inclusion in the CSM. Likewise, all coastal processes could be considered for exclusion as a group. For each FEP, the rationale behind its grouping was noted. No FEPs were excluded at this step, but nearly all were consolidated with others. This consolidation process reduced the total number to 135 unique FEP groupings.

3.0 Classifying Features, Events, and Processes

Following the normalization and consolidation steps, the 135 unique FEP groups were carried forward to the classification step and were considered for inclusion in the conceptual model scenarios. The classification is principally an organizational tool for the FEP analysis, although the categories identified also relate to components of the CSM. The 135 unique FEP groups were classified into the following 18 categories:

- Celestial
- Climate change
- Containerization
- Contaminant Migration
- Engineered Features
- Exposure
- Hydrology
- Geochemical
- Geological
- Human Processes
- Hydrogeological
- Marine
- Meteorology
- Model Settings
- Other Natural Processes
- Source Release
- Tectonic/Seismic/Volcanic
- Waste

These categories are relevant to the development of scenarios and are integral to the CSM for the Clive Facility. Occasionally, a FEP could have been classified into more than one category. However, the overall goal of the FEP analysis is to identify those processes that should be carried forward into the CSM, and subsequently into the modeling. Provided each FEP is identified in one of the categories, it was carried forward to the CSM. Ultimately, each FEP was

given due consideration, and the implementation of relevant FEPs in the final modeling was rather independent of the classification.

4.0 Screening of FEPs

The long list of FEPs was screened in consideration of regulatory concern and professional judgment based on physical reasonableness, probability of occurrence, severity of consequence, and assessment scope.

The most basic screening criterion is regulatory concern. Regulatory requirements for performance of EnergySolutions' Clive facility are published in 10 CFR 61 and Utah Administrative Code R313. While the mention of something that can be construed as a feature, event, or process in the text of a regulation triggers its consideration in this FEP analysis, it does not mean that the FEP must become part of the PA analysis or modeling.

A subjective element of the FEP screening process is consideration of assessment scope and physical reasonableness. Physical reasonableness is a professional judgment based on logical arguments using available data and information to support a conclusion of whether or not conditions can exist within the period of regulatory concern that will result in the occurrence of a particular event or process that affects disposal system performance. In addition to meeting screening criteria, some FEPs were retained as model parameters specifically because they pertain to scenario development itself (e.g., exposure terms).

The inclusion or dismissal of FEPs and associated rationale is documented in support of constructing the conceptual model and scenarios. The product of this screening procedure is the identification of those FEPs that, either alone or in conjunction with others, could affect the performance of the disposal system.

4.1 Regulatory Considerations, Guidance, and Supporting Information

This section discusses the regulatory language, guidance, and other supporting information to be considered in developing scenarios and conceptual models for the Clive Facility PADU PA Model. Specific considerations of NRC's land disposal performance requirements (10 CFR 61 Subpart C) are required for the PA-scenario development and are important to document as part of the FEP compilation and screening activity. In addition, observations and recommendations previously published by radioactive waste disposal facility working groups and technical advisers are also considered, although most of these are focused on geologic disposal of radioactive wastes.

Specific provisions of regulations for the operation and closure of a land-disposal LLW facility were specifically considered if they were mentioned in a regulatory document.

Based on these provisions, 55 of 135 FEPs were identified as relevant for evaluation in the conceptual model or exposure scenarios. The remaining FEPs were dismissed from further

consideration for various reasons. Some, like a direct impact from a large meteorite, are simply beyond the scope of the PA-analysis. Tsunami and other marine phenomena obviously do not apply at the Clive facility. Several FEPs from the original sources were dismissed because they apply only to geologic repositories, or to specific types of containment, like copper canisters for used nuclear fuel.

4.1.1 Nuclear Regulatory Commission: 10 CFR 61

This regulation contains Federal procedural requirements and performance objectives applicable to land disposal of radioactive waste. Specific considerations of 10 CFR 61 include attributes of facility siting, facility engineering (including post-closure stability and control), site monitoring, record-keeping, protection of health and safety, and a minimum time frame for which an assessment must be conducted to ensure long-term stability of the disposal site. The types of FEPs-objectives mentioned in 10 CFR 61 include:

- long-term effectiveness based on physical siting of the disposal unit (including site geology and hydrology),
- protection of the general population (in terms of radiological dose),
- protection of inadvertent intruders (dose),
- protection of individuals during operations (dose),
- isolation and segregation of wastes,
- limitation of releases of radionuclides via pathways in air, water, surface water, plant
 uptake, or exhumation by burrowing animals releases of radionuclides via pathways in air,
 water, surface water, plant uptake, or exhumation by burrowing animals,
- long-term stability of the disposal site,
- evaluation of engineering failures, including erosion, mass wasting, slope failure, settlement of wastes and backfill, infiltration through covers, and surface drainage,
- site monitoring requirements,
- identification of natural resources whose exploitation could result in inadvertent exposure, and
- efficacy of institutional controls.

4.1.2 Utah Administrative Code R313: Radiation Control

The Utah Administrative Code (UAC) Rules 313-15 (Standards for Protection Against Radiation) and 313-25 (License Requirements for Land Disposal of Radioactive Waste) mirror the provisions for land disposal of radioactive waste provided in 10 CFR 61. Notable performance objectives of near-surface disposal sites established of UAC Rule R313-25 include Notable technical performance objectives of near-surface disposal sites established of UAC Rule R313-25 include:

- protection of the general population,
- protection of inadvertent intruders,

Formatted: Font: Not Italic

Formatted: Font: Not Italic

- consideration of releases of radionuclides through pathways via air, water, surface water, plant update, and exhumation of burrowing animals,
- protection of individuals during operations,
- long-term stability of the disposal site,
- prevention of erosion, mass wasting, slope failure, settlement of wastes and backfill, infiltration through covers, and surface drainage,
- site monitoring requirements, and
- identification of natural resources whose exploitation could result in inadvertent exposure.

The majority of the FEPs identified as relevant under 10 CFR 61 are also applicable under UAC Rule R313-25 and are retained for analysis.

4.1.3 Additional Guidance

The NRC's PA working group has identified additional considerations in NRC's *Performance Assessment Methodology* (NRC 2000). The working group identifies two specific areas of interest in conducting a PA: pathway analysis and dose assessment.

Pathway analysis involves the mechanisms of radionuclide transfer through the biosphere to humans. These mechanisms, or transport and exposure pathways, must be identified and modeled. Pathway analysis should result in the determination of the total intake of radionuclides by the average member of the critical group. The critical group is defined as the "...group of individuals reasonably expected to receive the greatest dose from radioactive releases from the disposal facility over time, given the circumstances under which the analysis would be carried out" (NRC 2000).

Various considerations should be taken into account when analyzing the transport of radionuclides through the biosphere (to humans). These considerations should include

- modeling the movement of radionuclides through the environment and the food chain, adequately reflecting complex symbiotic systems and relationships,
- considering mechanisms of (biotic and) human uptake of radionuclides, and
- identifying usage, production, and consumption parameters, for various food products and related systems, that may vary widely, depending on regional climate conditions, local or ethnic diet, and habits.

The dose assessment requires that the dosimetry of the exposed individual be modeled. The objective of dose modeling in a LLW PA is to provide estimates of potential doses to humans, in terms of the average member of the critical group, from radioactive releases from a LLW disposal facility, after closure.

A "current conditions" philosophy is initially applied to determine which pathways are to be evaluated. That is to say that current regional land use and other local conditions in place at the

Formatted: Indent: Left: 0.39", Hanging: 0.1", Tab stops: Not at 0.8"

Formatted: Indent: Left: 0.39", Hanging: 0.1", Tab stops: Not at 0.8"

time of the analysis will strongly influence pathways that are considered to be significant. The conceptual model and scenarios must consider each of the general pathways discussed in 10 CFR 61.13. Additional pathways for consideration are published in NUREG/CR-5453 (Shipers, 1989) and NUREG-1200 (NRC, 1994). NUREG-1200 discusses example potential "scenarios by which radioactivity may be released from the disposal facility and cause the potential for radiological impacts on individuals." Shipers (1989) identifies exposure pathways, and scenarios regarding transport mechanisms that could contribute to the release of radioactive materials from the disposal facility leading to human exposure, in the context of near-surface LLW disposal.

4.2 Scope of Assessment and Physical Reasonableness

The final phase of FEP screening is the application of professional judgment in terms of the scope of the PA and the physical reasonableness of evaluating those FEPs in the CSM and scenarios. Performance objectives include protection of the general population from releases of radioactivity (10 CFR 61.41), protection of individuals from inadvertent intrusion (§61.42), and stability of the site after closure (§61.44). Assumptions of the scope of the PA include:

- Performance assessment reflects post-closure conditions. Because PA considers the site
 only after closure, consideration of the protection of individuals during operations
 (§61.43) is not within the scope of the evaluation and FEPs related to operations are not
 considered relevant to the CSM or scenarios.
- Land-use assumptions relative to human exposures post-closure are based on current conditions and likely future conditions. Therefore urban settlement, residential use, farming, and aquaculture and FEPs pertaining to these incongruous uses are not included in the CSM or scenarios because of the high concentrations of salt in the soil and groundwater of this site. However, hunting, ranching, and recreational use are considered viable scenarios.
- Intentional human intruders are not protected.

5.0 Screening Results

Using the identification and screening processes described in Sections 1 through 3, FEPs consolidated from an exhaustive list of over 900 to 135 FEPs or FEP categories. consolidation, 90 FEPs are retained for further consideration and 45 FEPs were inclusion in the PA model. All FEPs considered and retained for inclusion in the scenarios are reported in

Formatted: Indent: Left: 0.39", Hanging: 0.1", Tab stops: Not at 0.8"

<u>Table 2 Table 2</u> in the Appendix. FEPs that were considered and dismissed from evaluation in the CSM and scenarios are listed in Table 3, along with a brief rationale for their exclusion.

In summary, FEPs retained for consideration in the PA, CSM, and scenarios pertain to regulatory aspects of post-closure protection of human health and long-term stability of the disposal facility for the duration and spatial scope of the assessment period. FEPs that were dismissed from consideration in the PA include those that do not fall within the scope of the PA, were characterized as extremely unlikely to occur or having a low magnitude of consequence of affecting the performance of the repository, or were dismissed based on site-specific considerations.

6.0 Use of FEPs for Conceptual Model and Scenario Development

The CSM provides detailed descriptions of the physical environment, the engineered disposal facility, the sources and chemical forms of disposed wastes, potentially affected media, potential release pathways and exposure routes, and potential receptors. The CSM considers broad categories of FEPs that are relevant to these attributes, but individual FEPs may or may not be addressed in the CSM based on the scope of the assessment and the scenarios developed. This section identifies the FEPs that are considered for inclusion in the CSM and are addressed in the development of scenarios for the PA model. These are grouped into several categories, and listed in tabulated form in Appendix B. Those FEPs that were dismissed from consideration in the modeling are listed in Appendix C. Some FEPs may overlap or repeat between categories.

Meteorology

Frost weathering and other meteorological events (e.g., precipitation, atmospheric dispersion, resuspension) are considered in the conceptual model. Weathering may occur from frost cycles. Resuspension of particulates from surface soils allows them to be redistributed by atmospheric dispersion, which is a meteorological phenomenon. Dust devils are also possible at the site and a tornado occurred in Salt Lake City in 1999, which was the first tornado in Utah in over 100 years.

Climate change

Features, events, and processes of climate change considered in the conceptual model include effects on hydrology (including lake effects), hydrogeology, biota, and human behaviors. Lake effects include appearance/disappearance of large lakes and associated phenomena (sedimentation, wave action, erosion/inundation). Wave action, including seiches, is included in the CSM.

Hydrology

Hydrology is addressed in the conceptual model since it influences many processes in contaminant transport. Examples of FEPs considered for the conceptual model include groundwater transport, inundation, and water table changes.

Hydrogeological

Several hydrogeological FEPs were identified for consideration in the conceptual model. Groundwater transport, in both the unsaturated and saturated zones, is potentially a significant transport pathway. For some model endpoints, such as groundwater concentrations that are compared to groundwater protection levels (GWPLs), it is the only pathway of concern.

Groundwater flow and transport processes include advection-dispersion, diffusion, fluid migration, waterborne contaminant transport, changes in the flow system, recharge, water table movements, and brine interactions. Inundation of the site may occur due to changes in lakes or reservoirs, which is included in lake effects of climate change.

Geochemical

Geochemical effects include chemical sorption and partitioning between phases, aqueous solubility, precipitation, chemical stability, complexation, changes in water chemistry (redox potential, pH, Eh), fluid interactions, speciation, interactions with clays and other host materials, and leaching of radionuclides from the waste form. These processes are addressed in the model.

Other Natural Processes

The broad category of other natural processes considered for the conceptual model include ecological changes and pedogenesis (soil formation). Ecological changes are associated with catastrophic events (e.g., inundation), evolution, or climate change. Pedogenesis is expected on the cap, giving rise to vegetation growth or habitation by wildlife.

Denudation (cap erosion) may be sufficient to expose waste. Erosion of the repository resulting from pluvial, fluvial or aeolian processes can result from extreme precipitation, changes in surface water channels, and weathering. Sediment transport is an inherent aspect of erosion. Sedimentation/deposition onto the repository would also affect disposal at the site.

Note that seismic activity is unlikely to impact the Clive facility. Faults are not present within the vicinity of Clive, although effects of isostatic rebound are still possible in the Lake Bonneville area.

Engineered Features

Engineered features are intended to promote containment and inhibit migration of contaminants. Conditions potentially affecting site performance include failure of general engineered features, repository design, repository seals, material properties, and subsidence of the repository.

Containerization

Two key components of containerization were identified as FEPs: containment degradation and corrosion. Canister degradation, including fractures, fissures, and corrosion (pitting, rusting) could result in containment failure. These processes are evaluated in the conceptual model_(Conceptual Site Model Wwhite Ppaper, Section 8.1).

Formatted: Font: Italic

Waste

Attributes of waste that could influence the performance of the Clive facility include the inventory of radionuclides, physical and chemical waste forms, container performance, matrix performance, leaching, radon emanation, and other waste release mechanisms.

Source Release

Source release can result from many mechanisms, including containment failure, leaching, radon emanation, plant uptake, and translocation by burrowing animals. FEPs that fit in the category of source release include gas generation, radioactive decay and in-growth, and radon emanation.

Contaminant Migration

Contaminant migration for the CSM includes the mechanisms and processes by which radionuclides may come to be located outside of the containment unit. The following contaminant migration processes were identified for consideration in the conceptual model: resuspension, atmospheric dispersion, biotically-induced transport, contaminant transport, diffusion, dilution, advection-dispersion, dissolution, dust devils, tornados, infiltration, and preferential pathways.

Animal ingestion is part of the human exposure model, both as ingestion of fodder and feed by livestock, and ingestion of livestock by humans. Transport by atmospheric dispersion is modeled and is associated with limited resuspension, dust devils, and tornados. Modeling of biotic (plant-and animal-mediated) processes leading to contaminant transport, and the evolution of these processes in response to climate change and other influences, including bioturbation, burrowing, root development, and contaminant uptake and translocation are considered. Contaminant transport includes transport media (water, air, soil), transport processes (advection-dispersion, diffusion, plant uptake, soil translocation), and partitioning between phases. Diffusion occurs in gas and water phases. Dilution occurs when mixing with less concentrated water. Hydrodynamic dispersion is associated with water advection. Dissolution in water is limited by aqueous solubility. Transport in the gas phase includes gas generation in the waste, partitioning between air and water phases, diffusion in air and water, and radioactive decay and ingrowth. Infiltration of water through the cap, into wastes, and potentially to the groundwater is another contaminant migration concern. Preferential pathways for contaminant transport are also addressed.

Human Processes

The FEPs identified as human processes encompass human behaviors and activities, resource use, and unintentional intrusion into the repository. Human process FEPs identified for assessment are related to the human exposure model and include anthropogenic climate change, human behavior, human-induced processes related to engineered features at the site, human-induced transport, inadvertent human intrusion, institutional control, land use, post-closure subsurface activities, waste recovery, water resource management, and weapons training such as that occurring at nearby bombing ranges.

Exposure

Exposure is an integral part of the conceptual model, and may result from reduced site performance. Exposure-relevant FEPs identified for evaluation include those related to dosimetry, exposure media, human exposure, ingestion pathways, and inhalation pathways. Dosimetry as a science is not a FEP *per se* but physiological dose response is accounted for in the PA model.

Transport pathways (e.g. food chains) that lead to foodstuff contamination, and human exposures due to inhalation of gaseous radionuclides and particulates are included. Exposure media include are foodstuffs, drinking water, and environmental media. Exposure pathways (ingestion, inhalation, etc.) and physiological effects from radionuclides and toxic contaminants (e.g. uranium) are also assessed.

Model Settings

Model settings that were identified during the FEP compilation process include model parameterization, period of performance, regulatory requirements, and spatial domain. While these are not FEPs in and of themselves, they are important considerations in the performance assessment model and are included with the FEPs for completeness.

Table 2. List of consolidated FEPs evaluated for inclusion in the conceptual site model and scenarios

scena	rios				
Table 2 (continue Neptune Subgroup	Normalized FEP	Discussion	Representative 4		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	(accepted)		FEP IDs 1		space between paragraphs of the same style Formatted: Superscript
Climate change	climate change	Climate change can have a large influence on site performance. Climate change includes natural and anthropogenic changes and its effects on hydrology (including lake effects), hydrogeology, glaciation, biota, and human behaviors.	2, 3, 4, 159, 221, 4 222, 252, 253, 254, 321, 349, 350, 416, 417, 519, 520, 521, 522, 523, 524, 651, 652, 653, 811, 812, 813, 814		Formatted: Superscript Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	lake effects	A large lake could have detrimental effects on the repository. Lake effects include appearance/ disappearance of large lakes and associated phenomena (sedimentation, wave action, erosion/inundation, isostasy). This is covered within climate change scenarios. Regulations suggest consideration.	656, 789		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	wave action	Wave action, including seiches, could influence site performance and is included in long-term scenarios. See lake effects and erosion/inundation.	224, 790		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Containerization	containment degradation	A number of processes can contribute to degradation of waste containment. These are accounted for in release of the source term. It is expected that no credit will be given to containment. Regulations suggest consideration.	7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 352, 496, 527, 657, 658, 817, 818, 819, 820		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	corrosion	Corrosion is one of the processes that would contribute to degradation of waste containment. Regulations suggest consideration.	18, 19, 20, 161, 353, 419, 659, 821	***************************************	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Contaminant Migration	biotically- induced transport	Plant uptake and burrow excavation are potential contaminant transport (CT) pathways. Modeling includes biotic (plant- and animal-mediated) processes leading to contaminant transport, and the evolution of these processes in response to climate change and other influences, including bioturbation, burrowing, root development, and contaminant uptake and translocation. Regulations suggest consideration.	21, 420, 529, 530, 531, 532, 533, 534, 661, 662, 663, 664, 665, 791, 822		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	colloid transport	Colloid formation could be a CT pathway. This process will be considered in the geochemistry conceptual model.	22, 23, 24, 535, 4 666, 823		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style

Table 2 (contii Neptune	Normalized	Discussion	Representative		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Subgroup	FEP (accepted)	Discussion	FEP IDs ¹		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	,	OT : I			Formatted: Superscript
	contaminant transport	CT is a large class of processes that govern the migration of contaminants in the environment, including transport media (water, air, soil) processes (advection-dispersion, diffusion, plant uptake, soil translocation) and partitioning between phases; much overlap with atmospheric, groundwater, surface water, and biotically-induced transport. Regulations suggest consideration.	25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 162, 163, 257, 301, 302, 303, 304, 305, 323, 354, 355, 356, 421, 536, 537, 538, 539, 540, 667, 668, 669, 670, 671, 672, 673, 824, 825, 826, 827, 828, 829, 830		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	diffusion	Diffusion is a basic CT process that could affect performance. Diffusion occurs in gas and water phases.	36, 306, 324, 674, 831		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	dilution	Dilution is a basic CT process that could affect performance. Dilution occurs when mixing with less concentrated water.	37, 675, 832		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	dispersion	Dispersion is a basic CT process that could affect performance. Hydrodynamic dispersion is associated with water advection.	38		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	dissolution	Dissolution will govern leaching of the waste form into water, limited by aqueous solubility.	39, 40, 164, 225, 258, 325, 326, 422, 541, 676, 833		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	dust devils	Dust devils are common on the flats, and could disperse contaminants. These are included in atmospheric dispersion.	792		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	gas transport	Radon produced in the waste is likely to be transported via gaseous diffusion. Transport in the gas phase includes gas generation in the waste, partitioning between air and water phases, diffusion in air and water, and radioactive decay and ingrowth.	42, 43, 44, 165, 166, 259, 357, 423, 542, 543, 544, 678, 679, 835		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	infiltration	Infiltration through the cap materials, the waste, and unsaturated zone could be an important CT mechanism. This includes infiltration of meteoric water (precipitation minus abstractions) through the cap, into wastes, and potentially to the groundwater.	45, 260, 307	4	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	local geology	This feature will control some aspects of CT and is included implicitly in other processes. Regulations suggest consideration.	545, 546, 547	1	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style

Table 2 (contin	nued)			4	Formatted: Space After: 0 pt, Don't add
Neptune Subgroup	Normalized FEP (accepted)	Discussion	Representative 4 FEP IDs.1		space between paragraphs of the same style Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
		Dreferential nothways sould contribute to CT			Formatted: Superscript
	preferential pathways	Preferential pathways could contribute to CT. Their presence is accounted for in the definition of advective and diffusive processes. Regulations suggest consideration.	46		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Engineered Features	compaction error	Inadequate compaction could result in subsidence. This overlaps with subsidence and closure failure.	680, 836		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	engineered features	Many engineered features are intended to improve performance. This large collection of features is intended to promote containment and inhibit migration of contaminants. Regulations suggest consideration.	48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 167, 168, 169, 170, 226, 227, 228, 261, 308, 309, 327, 359, 360, 361, 362, 363, 425, 426, 427, 428, 429, 430, 431, 432, 497, 498, 548, 549, 550, 551, 552, 553, 554, 555, 681, 682, 683, 684, 685, 686, 687, 688, 689,690	•	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	material properties	Material properties are an essential feature of any model, and include density, porosity, hydraulic conductivity, permeability, texture, tortuosity, etc. of waste, backfill, cap materials, and naturally occurring materials.	60, 61, 62, 171, 364, 433, 692, 852, 853, 854		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	repository design	Respository design clearly influences its performance. This is accounted for implicitly in the modeling of the repository. Regulations suggest consideration.	695, 696, 858, 859	•	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	source release	Source release is an essential part of the model, and can result from many mechanisms, including containment failure, leaching, radon emanation, plant uptake, and translocation by burrowing animals.	128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 196, 291, 342, 398, 467, 468, 637, 770, 771, 772, 773, 774, 775, 958, 959, 960, 961, 962, 963, 964	•	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style

Table 2 (conti				_	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Neptune Subgroup	Normalized FEP (accepted)	Discussion	Representative 4 FEP IDs. 1	\	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	subsidence of	Subsidence can compromise performance,	310, 311, 329,	1	Formatted: Superscript
	repository	leading to failure of the cap, and enhanced infiltration. Regulations suggest consideration.	439, 861		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	waste	Waste form and inventory are essential parts of the model. Inventory and source release includes initial inventory of radionuclides and its physical and chemical form, container performance, matrix performance, leaching, and other release mechanisms.	517, 647, 648, 649		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same styl
Exposure	animal ingestion	Human ingestion of livestock and game exposed to contaminants is an exposure pathway, and is implemented as part of the human exposure model, as ingestion of fodder and feed by livestock, and ingestion of livestock by humans, and similar pathways for game. Regulations suggest consideration.	660		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same styl
	dosimetry	Dosimetry hints at human dose response, which is an integral part of PA. Physiological dose response will be estimated in the PA model. Dosimetry as a science is not a FEP, <i>per se</i> . Regulations suggest consideration.	560, 561	_	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same styl
	exposure media	Exposure media are a fundamental part of exposure pathways, and include foodstuffs, drinking water, other environmental media. These are included in the human exposure model. Regulations suggest consideration.	562, 563		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same styl
	human behavior	Behavior is part of human exposure pathway. Future human behaviors include activities and their frequency and duration, distinct from food and water ingestion. Regulations suggest consideration.	584, 585, 586, 587, 588		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same styl
	human exposure	Human exposure, in terms of dose and toxicity, is considered in the model, and includes exposure pathways (ingestion, inhalation, etc.) and physiological effects from radionuclides and toxic contaminants. Regulations suggest consideration.	68, 564, 565, 566, 567, 568, 569, 570, 571, 801, 802		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same styl
	ingestion pathways	Ingestion of food, water, and soils are modeled human exposure pathways. These include human exposures due to ingestion of water and foodstuffs, and transport pathways (e.g. food chains) that lead to foodstuffs. Regulations suggest consideration.	572, 573, 574		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same styl

Neptune Subgroup	Normalized FEP (accepted)	Discussion	Representative 4 FEP IDs ¹		space between paragraphs of the same style Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	• • •				Formatted: Superscript
	inhalation pathways	Inhalation of gases and fine particles are modeled human exposure pathways. Regulations suggest consideration.	794		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Geochemical	geochemical effects	Geochemical processes control CT in waste sources, water, and geologic media. These include chemical sorption and partitioning between phases, aqueous solubility, precipitation, chemical stability, complexing, changes in water chemistry (redox potential, pH, Eh), fluid interactions, halokinesis, diagenesis, speciation, cellulosic degradation effects, interactions with clays and other host materials, effects of corrosion products, effects of cementitious materials, and leaching.	69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 174, 264, 368, 440, 575, 576, 577, 698, 699, 700, 701, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Human Processes	anthropogenic climate change	This is addressed as part of climate change in general.	85, 580, 706, 879		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	community development	Development of communities and other human habitation overlaps with land use and habitation, and is considered in the human exposure assessment, albeit unlikely. See inhabitation, land use. Regulations suggest consideration.	581		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	excavation	Excavation includes construction of basements and other construction, and is included as part of the human intrusion scenarios.	330, 499, 582, 709, 710, 882, 883	4	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	explosions	Human-caused explosions include bombs, plane crashes, and conventional weapons training.	230, 500, 583, 804	-	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	human-induced processes	Human-induced processes are limited to repository design, inadvertent human intrusion, or human-induced climate change. Engineered features include repository design and new technological developments. Intentional intrusion is not considered. Anthropogenic climate change is considered under climate change.	90, 91, 92, 177, 271, 272, 372, 443, 589, 590, 712, 713, 886	4	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	human-induced transport	Human activities that could contribute to release are considered. Humans can induce contaminant transport through a variety of activities. See inadvertent human intrusion.	273, 274, 591, 592, 795, 887		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	inadvertent human intrusion	Inadvertent human intrusion into the waste is considered in the development of exposure pathways. Regulations suggest consideration.	178, 179, 231, 275, 276, 277, 373, 374, 375, 444, 445, 446, 714, 805, 806, 888	4	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style

Table 2 (continue Neptune	Normalized	Discussion	Representative -	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
Subgroup	FEP (accepted)			Formatted: Space After: 0 pt, Don't add space between paragraphs of the same sty	
	inhabitation	Inhabitation on or near the site, including the	93, 94, 593, 594,	Formatted: Superscript	
	imabilation	establishment of surface or underground dwellings, communities, or cities, is extremely unlikely. See community development, land use. Regulations suggest consideration.	807	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
	institutional control	Institutional control affects human exposures, and includes records of site knowledge, markers, barriers, and security, and the loss thereof. Regulations suggest consideration.	95, 595, 596, 597, 716, 890	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
	land use	Land use in general could affect exposure scenarios. Land use changes are related to demographics, including development of agricultural, industrial, urban, or wild land uses. Regulations suggest consideration.	183, 450, 600, 601, 602, 719, 720, 893, 894, 895	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
	post-closure subsurface activities	Subsurface human activities are covered to the extent that they are inadvertent. This could include intrusion, construction, investigation, drilling, or mining. Regulations suggest consideration.	727, 904, 905, 906	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
Hydrogeological	denudation	Denudation could expose wastes, and is combined with erosion and inundation. Regulations suggest consideration.	192, 388, 460, 502, 503, 739, 917	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
	erosion	Erosion of the repository resulting from pluvial, fluvial, or aeolian processes can result from extreme precipitation, changes in surface water channels, and weathering. Regulations suggest consideration.	110, 238, 284, 389, 504, 613, 740, 918, 919, 920, 921	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
	erosional transport	Erosional (sediment) transport could be a CT mechanism. Sediments may move during erosion; includes solifluction. Regulations suggest consideration.	111, 239, 614, 615, 741, 742, 922, 923	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
	hydrogeological effects	Hydrogeological and groundwater hydraulics changes may occur in response to geological changes, including hydrothermal activity. This is generally covered under groundwater transport. Regulations suggest consideration.	112, 616, 617, 618, 619, 743, 744, 796, 924	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
	sedimentation	Sedimentation would occur on a lake bottom, and could affect performance. This includes sedimentation/aggradation onto the repository.	113, 193, 285, 335, 390, 461, 621, 797	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	

Table 2 (continu				Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Neptune Subgroup	Normalized FEP (accepted)	Discussion	Representative 4 FEP IDs ¹	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Hydrology	groundwater transport	Groundwater transport includes waterborne contaminant transport (CT) in the unsaturated and saturated zones, and is a principal CT mechanism. Groundwater flow and transport mechanisms include advection-dispersion, diffusion, fluid migration, waterborne contaminant transport, changes in the flow system, recharge and discharge, water table movements, and brine interactions.	114, 115, 116, 117, 118, 286, 312, 313, 314, 315, 316, 336, 337, 338, 339, 392, 393, 622, 623, 747, 748, 749, 750, 751, 752, 929, 930, 931, 932, 933, 934, 935, 942	Formatted: Superscript Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	hydrological effects	Hydrological processes are considered under the topics of surface water and groundwater. Regulations suggest consideration.	463, 505, 624, 753, 754, 936, 937	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	inundation	Inundation by a large lake or reservoir is likely to affect the site in the long term. (See also: wave action, and lake effects). Regulations suggest consideration.	755, 798, 938, ••• 939	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Meteorology	frost weathering	Weathering from frost cycles is included in cap degradation modeling.	758, 943	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	meteorology	Meteorology is considered indirectly; meteorology as a science is not a FEP, per se, but contributes to other processes, such as precipitation and atmospheric dispersion, which are covered elsewhere. Regulations suggest consideration.	626, 627, 761, 946, 947	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	resuspension	Resuspension will affect site performance, allowing particulates from surface soils to be redistributed by atmospheric dispersion.	981	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	atmospheric dispersion	Atmospheric dispersion is a potential CT pathway and is modeled. See also: dust devils. Regulations suggest consideration.	256, 528	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	tornado	Tornados are possible in the area.	289	Formatted: Space After: 0 pt, Don't add
Model Settings	model parameteri- zation	Parameterization is a fundamental part of modeling, though is not a FEP, per se.	628	space between paragraphs of the same style Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	period of performance	Definition of a period of performance is a fundamental part of PA modeling, though is not a FEP, per se.	629	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	regulatory requirements	Regulatory requirements drive much of the modeling in PA, though is not a FEP, per se.	630	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	spatial domain	Definition of a spatial domain is a fundamental part of modeling, though is not a FEP, per se.	631	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style

Neptune Subgroup	Normalized FEP (accepted)	Discussion	Representative 4 FEP IDs
Other Natural Processes	ecological changes	Changes in the types and abundance of plants and animals could affect performance. Changes in the ecology can be associated with catastrophic events (e.g. fire, inundation), evolution, or climate change.	762, 948, 949
	gas generation	Uranium wastes are expected to produce radon which will affect site performance in terms of doses. See also gas transport.	122, 123, 340, 396, 464, 634, 766, 953, 954
	pedogenesis	Soils are likely to develop on the cap and may affect performance.	765, 952
	radioactive decay and in- growth	Radioactive decay and ingrowth processes are essential to the model.	635, 767, 799, 955
	radon emanation	Radon emanation directly affects the mass of radon released into the environment, and hence site performance.	980
	reconcentration	Possible reconcentration of radiological materials during transport is accounted for in the CT modeling.	127
Tectonic/ Seismic/ Volcanic	geophysical effects	Geophysical changes to the engineered features of the site are accounted for in degradation. Geophysical effects include pressure, stress, density, viscosity, deformation, magnetics, creep, and elasticity.	141, 142, 143, 509, 641, 781, 970, 971

Subgroup	FEP (dismissed)	Discussion	FEP IDs.1		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Celestial	meteorite	The occurrence and consequences of a direct	1, 158, 219, 220,		Formatted: Superscript
Celestiai	impact	hit by a meteorite are out of the scope of this model.	251, 320, 348, 415, 491, 492, 493, 518, 650, 810		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Climate change	glacial effects	Glacial effects include presence of continental glaciers and resulting isostatic effects, glacial erosion, and periglacial effects. Glaciers in the basin are not modeled. Return of a large lake is expected should a glacial epoch return and is covered within climate change scenarios.	5, 160, 223, 255, 322, 351, 418, 494, 495, 525, 526, 654, 655, 815, 816		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	permafrost	The effects of permafrost are bounded by those of cap degradation, which considers more damaging freeze/thaw cycles. See frost weathering.	6, 300		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Contaminant Migration	gas intrusion	No mechanism for intrusion of naturally- produced gases into the repository has been identified.	41, 677, 834		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Engineered Features	convergence of openings	This FEP applies to mined repositories only.	837	4	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	design error	Errors in design could compromise performance but are not included in the modeling. Design error is distinct from construction or operational error.	47, 358, 424	•	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	material defects	Material defects are covered by degradation, and include material defects in source containment, closure cap, and other engineered materials.	691, 851	_	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	mechanical effects	Mechanical effects are covered implicitly by degradation, and include changes in mechanical properties and conditions, including failure.	63, 64, 65, 172, 262, 365, 366, 434, 435, 556, 557, 693, 694, 855, 856		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	release of stored energy	No significant energy is stored within the wastes.	66, 436, 857	_	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	repository seals	Regulations suggest consideration, but, the sealing of the repository shafts, boreholes, and construction and failure of such is applicable only to mined repositories.	67, 173, 229, 263, 328, 367, 437, 438, 558, 559, 697, 860		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style

Neptune	Normalized	Discussion	Representative	•	space between paragraphs of the same style
Subgroup	FEP (dismissed)		FEP IDs.1		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Exposure	agriculture	Agriculture includes establishment, evolution,	705, 803, 878		Formatted: Superscript
Exposure	agnounce	and abandonment of agriculture and aquaculture at and near the site. Regulations suggest consideration, however, none of these are expected to occur because of the high salinity of soils and groundwater at the site.	700, 000, 070		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Geological	diagenesis	Diagenesis in local lacustrine sediments could include the formation of interstitial evaporites, but is not expected to change site performance.	83, 175, 265, 369, 441, 578, 702, 875	-	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	gas or brine pockets	No gas or brine pockets have been identified below the site.	176, 370, 442, 579		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	landslide	Regulations suggest consideration, but landslides are not expected to occur in the flat lacustrine basin. Mass wasting of the site itself is covered under erosion.	266, 703, 876	4	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	local subsidence	Geological subsidence in the area is unlikely to seriously affect performance, and is not expected in the basin of lacustrine sediments.	267	-	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
Human Processes	accidents during operations	Regulations suggest consideration, but operational performance is not within the scope of the PA model.	84, 704, 877		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	climate control	No climate control at the facility is assumed. Climate control is a feature of certain mined repositories.	268, 371	•	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	closure failure	Regulations suggest consideration; however, poor closure includes abandonment or other failure to close the facility as planned, and is not modeled.	86, 87, 707, 708, 880, 881	-	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	fire	The waste is not combustible or explosive. Fires in the waste itself or following explosions are distinct from wildfire.	269, 270	•	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	fisheries	Regulations suggest consideration, but development of fisheries is not credible at the site.	884	•	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	geothermal energy production	No geothermal resources are identified at the site.	89, 711, 885	•	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	injection wells	Given the regional history, the construction of injection wells nearby for disposal of liquid wastes is possible. The effect of drilling such wells in the vicinity would be negligible, however.	232, 715, 889		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style

Tabl	 (continu	/\

Neptune	Normalized			space between paragraphs of the same style
Subgroup	FEP (dismissed)		FEP IDs.1	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	intentional	Intentional intruders are not protected and are	96, 180, 181,	Formatted: Superscript
	intrusion	not modeled as receptors. Intentional intrusion includes exhumation of waste, sabotage, terrorism, or archeological research.	278, 376, 377, 447, 448, 717, 808, 891	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	investigation	Site investigation is considered intentional, and receptors are not covered.	598, 599, 809	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	irrigation	Regulations suggest consideration, and irrigation could affect site performance, but will not occur since there is no suitable water source.	182, 233, 378, 449, 718, 892	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	monitoring	Monitoring of the site is required, but persons performing the activity are not protected since it is intentional and informed. Monitoring activities will not affect the performance of the site.	97, 603, 721, 896	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	nuclear testing	Regulations suggest consideration; however, testing of nuclear devices underground, at the ground surface, or in the atmosphere is considered intentional disruption of the site and is not covered.	98, 722, 897	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	operational effects	Operations could affect performance, and include normal site operation, closure, and later attempts at site improvement. Regulations suggest consideration; however, operations are not part of the PA.	99, 604, 605, 723, 724, 898, 899, 900	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	operational error	Covered under operational effects. Operational errors include poor quality site construction, waste emplacement, and site closure. Regulations suggest consideration, however, operations are not part of the PA.	100, 184, 279, 379, 380, 451, 725, 726, 901, 902, 903	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	quality control	Quality control is important to site operations, but is not a FEP that lends itself to modeling.	606	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	resource extraction	Regulations suggest consideration. Resource extraction is a type of intentional intrusion, including drilling, mining, or quarrying into the repository, or in such a way as to affect performance, in search of resources such as petroleum, natural gas, salt, rock, or geothermal resources. See intentional intrusion.	101, 102, 103, 185, 186, 234, 235, 280, 331, 332, 381, 382, 383, 452, 453, 501, 608, 609, 728, 729, 730, 731, 907, 908, 909, 910	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style
	sabotage	Sabotage is by its nature intentional. See intentional intrusion.	104, 187, 333, 384, 454, 732, 733, 911, 912	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style

Table	3 IC	ontin	near

	Table 3 (continued)				Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
Neptune Subgroup	Normalized Discussion FEP (dismissed)	Representative 4 FEP IDs.1		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style		
	tectonic effects	Tectonic effects could influence lake levels,	146, 147, 148,	_	Formatted: Superscript	
	tectoriic eriects	which are accounted for elsewhere.	140, 147, 148, 149, 212, 213, 410, 484, 643, 644, 784, 785, 974, 975, 976		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
	volcanism	No significant volcanism is expected in relevant time frames.	150, 214, 249, 250, 411, 412, 485, 486, 514, 515, 516, 645, 786, 800, 977	_	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
Waste	nuclear criticality	Nuclear criticality, while a concern for repositories of used nuclear fuel, is not a concern at this LLW site.	151, 152, 215, 297, 347, 413, 487, 646, 787, 978		Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
	other waste	The current analysis is constrained to examine depleted uranium wastes only, including associated "contaminant" waste. This rather vague reference to "other waste" will be addressed as the scope of wastes under consideration expands.	153, 154, 155, 156, 157, 216, 217, 218, 298, 299, 414, 488, 489, 490, 788, 979	_	Formatted: Space After: 0 pt, Don't add space between paragraphs of the same style	
4	The Representative FEP IDs correspond to the FEP IDs given in Table 1.			/	Formatted: Superscript	
+ <u>I The Representation</u>	we FEP IDS correspond to the FEP IDS given in Table 1.				Formatted: Don't add space between paragraphs of the same style
