Presentation Outline

- Performance Assessment Development
- The Clive Depleted Uranium PA
Features, Events, Processes (FEPs)
Conceptual Site Model

PA Development

- Performance assessment objectives
- ***Features, events, processes***
- ***Conceptual models***
- Mathematical models
- Computer model
- Model evaluation

Periodically revisit the PA model.

PA Objectives

- Evaluate future performance of a radioactive waste disposal system.
- Evaluate compliance with regulatory performance objectives (e.g., dose).
- Consider design alternatives that could help keep doses ALARA*.

*as low as reasonably achievable

PA Conditions

Spatial extent:

- Waste disposal configuration
- Exposure areas
- Groundwater and atmosphere

Waste inventory:

- Physical characteristics
- Radiological characteristics
- Chemical characteristics

PA Conditions: Time

Near time (within 10,000 y):

- Project current conditions/knowledge (society, technology)
- Estimate radiation doses

Deep time (peak activity after 10,000 y):

- Consider changes in climate

Potentially-Exposed Individuals

Based on current land use and activities:

- Persons who may gain access to the site following loss of institutional control
- Persons who may be exposed at off-site locations

Features, Events, and Processes

Features are characteristics of the Site, e.g.,
soil, geology, water, air, waste

Events might occur in the future, e.g.,
earthquakes, volcanoes, tsunamis,
meteors, ice ages

Processes are ongoing actions, e.g.,
subsidence, erosion, biotic mixing,
hydrology, geochemistry

Features, Events, and Processes

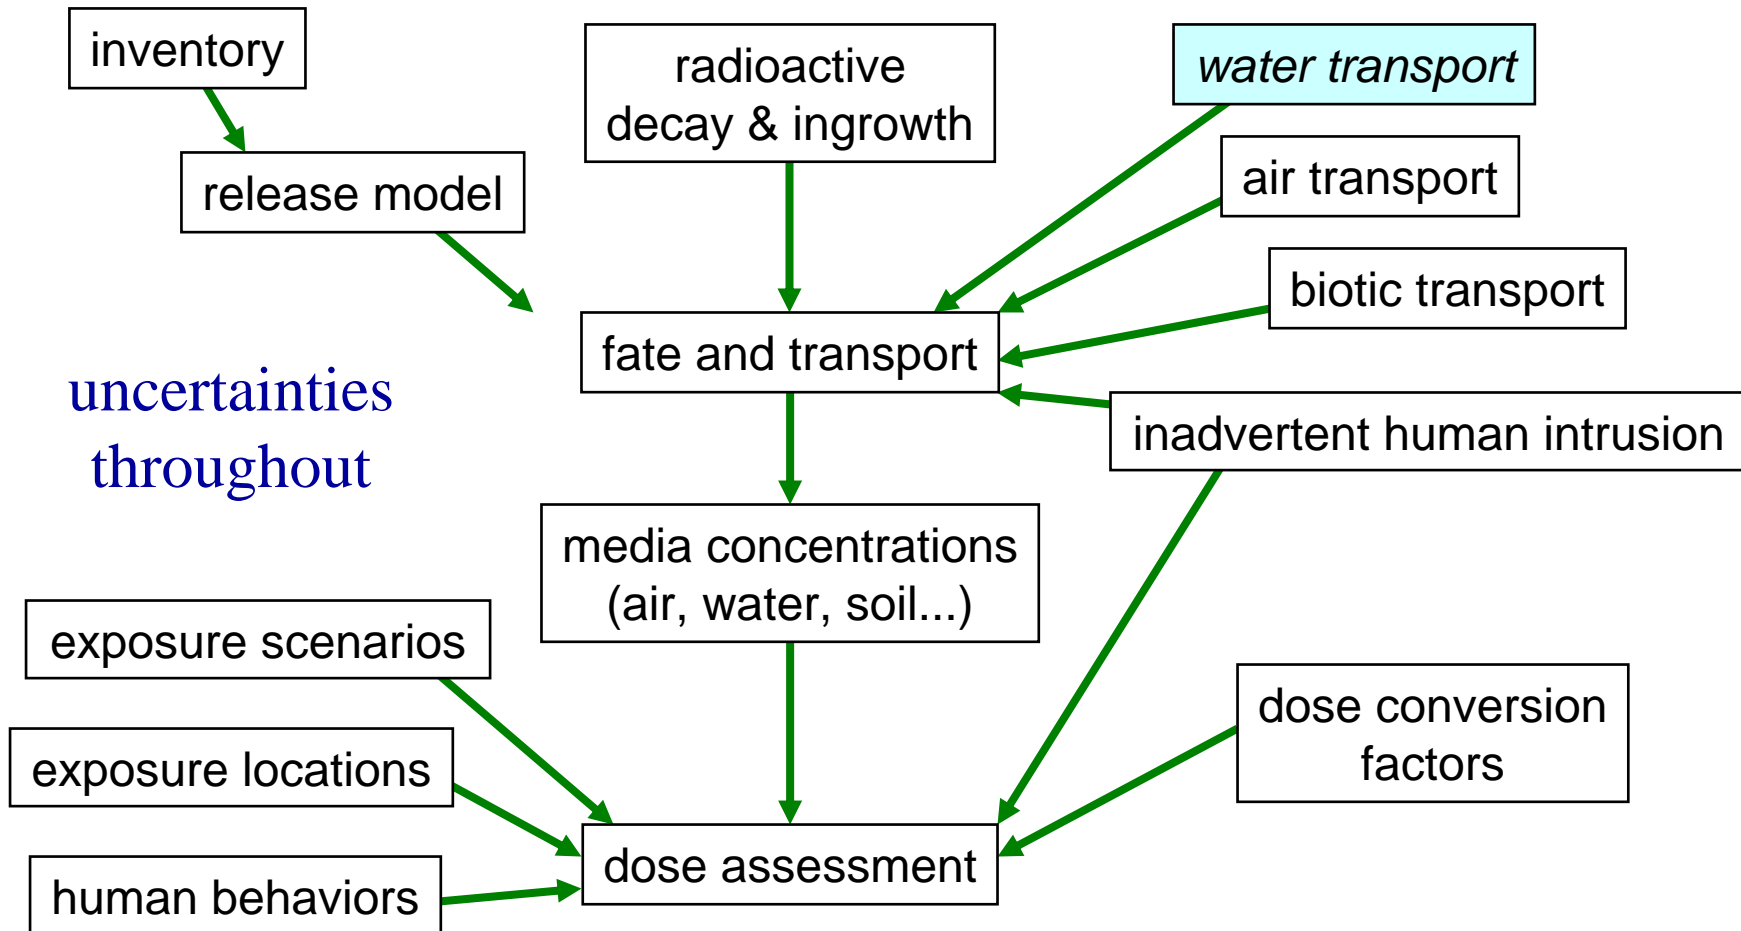

A comprehensive list of FEPs is compiled:

- Evaluate previous FEP work for PAs.
- Consider FEPs unique to the site.
- Combine redundant FEPs into categories.
- Screen out those that are irrelevant.
- Address those that are relevant by including them in the conceptual model.

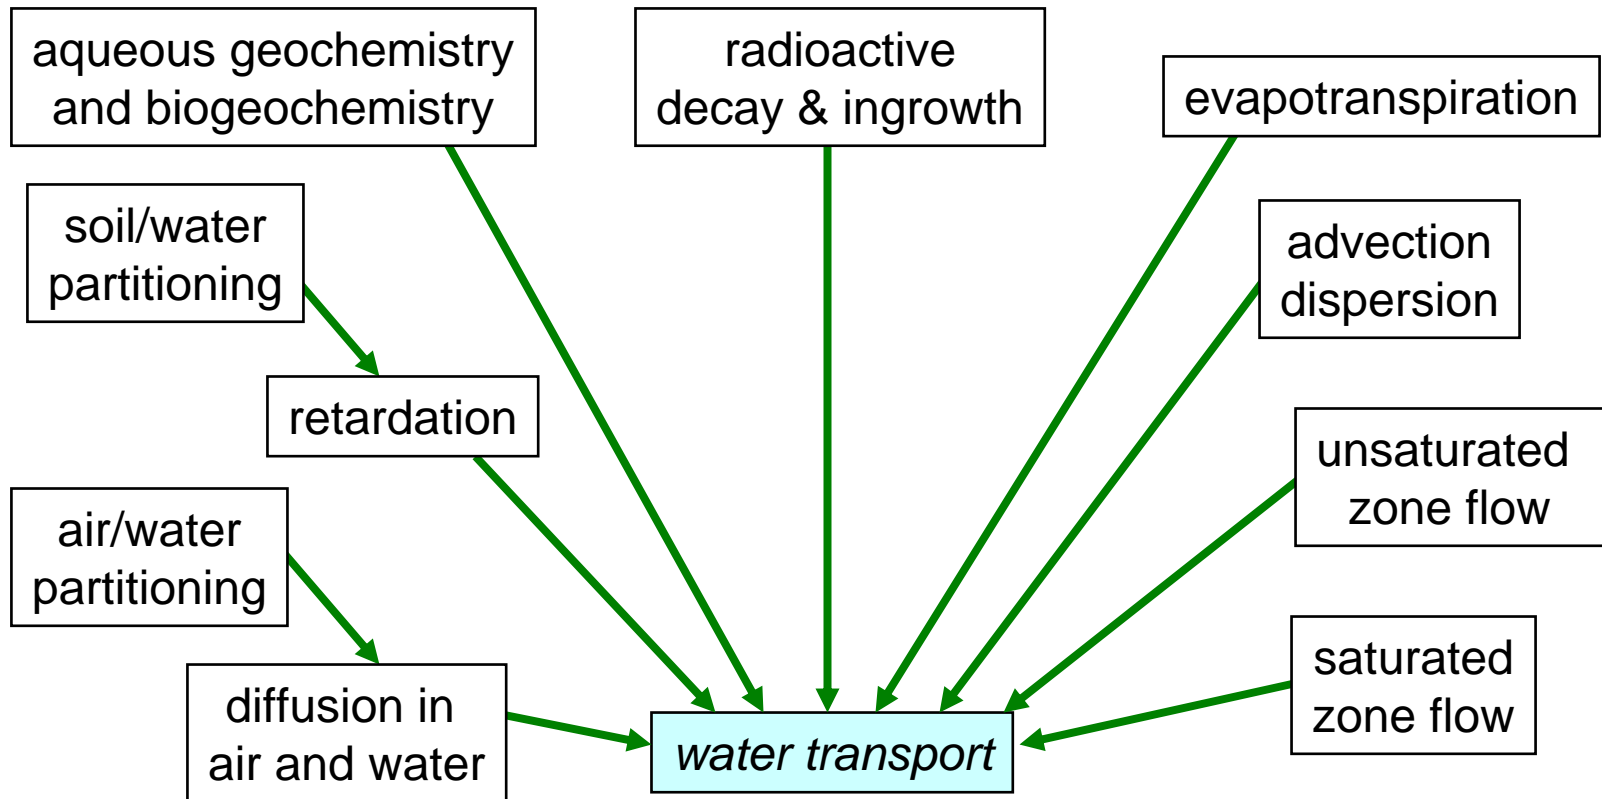

Conceptual Site Model (CSM)

- Inventory
- Engineered barriers
 - Release and transport into environment
- Environment
 - Transport
- Exposure scenarios
 - Dose
- Deep time
 - Consideration of future climate

A PA Influence Diagram

Influences in Water Transport

uncertainties throughout

CSM – Transport Examples

- “Water flows through porous media.”
- “Radon diffuses through interstitial air in porous media.”
- “Animals deposit burrow spoils on the ground surface, and burrows collapse.”
- “Wind carries contaminants in dust to other locations.”

These are developed into mathematical expressions and are implemented in the computer model.

Mathematical Models

Physical processes are modeled as coupled partial differential equations and transfer functions:

$$N_i = \lambda_1 \lambda_2 \cdots \lambda_{i-1} N_{1(0)} \sum_{j=1}^i \frac{e^{-\lambda_j t}}{\prod_{k \neq j} (\lambda_k - \lambda_j)}$$

$$\tilde{J} = -\theta_a D_s \nabla C$$

$$C_{water} = \left(1 + K_d \frac{\rho_b}{\theta_w} \right) \times C_{soil}$$

$$Q_{atm} = f_R \times C_{soil}$$

$$C_{air} = K_H \times C_{water}$$

$$\tilde{J} = -\theta_w D_s \nabla C$$

$$v_x = \frac{K}{n} \nabla h$$

$$C_{water} \leq C_{solubility}$$

Computer Modeling

- Systems-level modeling
 - Fully-coupled
 - Probabilistic
 - Supports global sensitivity analysis
- Supported by process-level models
 - More detailed modeling
 - Deterministic
 - Abstracted into the systems model

Statistical Support

- Develop input probability distributions using
 - Field or laboratory data and observations
 - Model abstraction
 - Information from the literature
 - Expert elicitation
- Uncertainty vs. variability
- Spatio-temporal scaling
- Correlation between input parameters

Evaluating the PA Model

- Test the model during development
- Thorough QA – traceability
- Uncertainty analysis
 - Compare results to objectives
- Sensitivity analysis
 - Global for input parameters
 - Simultaneous
 - Identify important input parameters

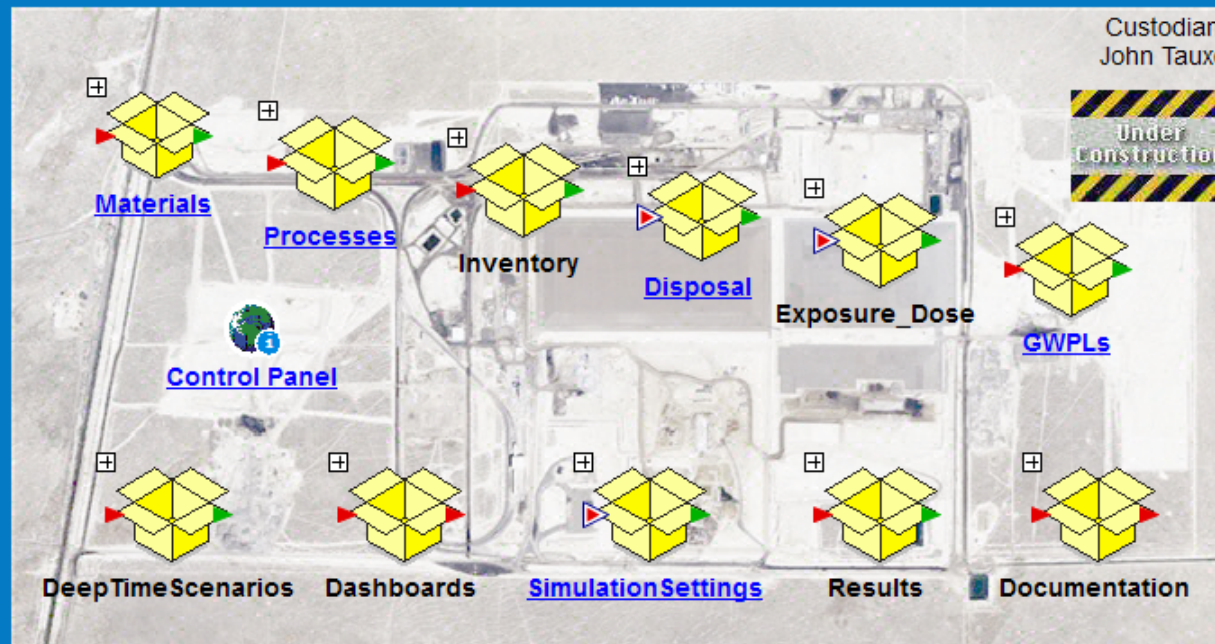

The Clive Depleted Uranium Performance Assessment

The Clive DU PA Model

A Performance Assessment for Disposal of Depleted Uranium
at the EnergySolutions Clive, Utah Facility

v0.008
October 2010

Custodian:
John Tauxe

ENERGYSOLUTIONS
www.energysolutions.com

Neptune and Company
www.neptuneandco.com

GoldSim version: 10.11sp3

Scope of the Clive DU PA

- Clive, Utah facility
- Depleted uranium wastes that are candidates for future disposal
- Single embankment: Class A South
- Address performance objectives specified in UAC R313-25-8

Quantitative for 10,000 y; qualitative after

PA Conditions: Clive Facility

Spatial extent:

- Class A South embankment
- Exposures on and off site
- Groundwater, soil, and atmosphere

Waste inventory:

- Powdered depleted uranium (DU)
as UO_3 and U_3O_8 (*not* UF_6)
- Associated contaminants in the DU

PA Conditions: Time

Near time (within 10,000 y):

- Project current conditions/knowledge (society, technology)
- Estimate radiation doses

Deep time (peak activity $>$ 2 million y):

- Consider changes in climate, including recurrence of large lakes

Clive PA Exposure Scenarios

On-site and adjacent Off-site areas

- Ranch workers:
 - herding, maintenance
- Recreationalists:
 - OHV users; hunting, camping

Off-site locations

- Travelers (highway, rail, Test Range access)
- OHV users (Knolls OHV Recreation Area)
- Resident (Grassy Rest Area at Aragonite)

Class A South Embankment

Modeling assumptions:

- Class A South only
- future DU waste only

FEPs for this PA

18 groups of FEPs were identified:

- Celestial
- Climate change
- Containerization
- Contaminant Migration
- Engineered Features
- Exposure
- Hydrological
- Geochemical
- Geological
- Human Processes
- Hydrogeological
- Marine
- Meteorological
- Model Settings
- Other Natural Processes
- Source Release
- Tectonic/Seismic/Volcanic
- Waste

The FEPs were then subjected to screening.

CSM topics: 10,000-y Model

- Inventory
- Engineering design
- Natural environment
- Contaminant transport
- Radiological decay and ingrowth
- Human exposure scenarios
- Dose assessment

CSM topics: Deep Time

- Return of a large lake
- Fate of cover
- Fate of wastes
- Radiological decay and ingrowth

Contaminant Transport Mechanisms: Near-Field

Inventory: DU Waste

Depleted Uranium Waste consists of

- DU: mostly ^{238}U by far, with little ^{235}U and very little ^{234}U
- Very small amounts of decay products
- Trace contaminants from introducing reprocessed U into the cascade:
 ^{99}Tc , ^{129}I , $^{\text{X}}\text{Pu}$, ^{237}Np

DU Waste Containment

Depleted UO_3 from the Savannah River Site is packaged in steel drums.

Depleted U_3O_8 from the gaseous diffusion plants (GDPs) is packaged in diffusion plant cylinders

No credit is taken for any packaging or containerization.

Activity of ^{238}U Progeny

Activity of progeny from 1 g U-238

Near-Field CT Mechanisms

Conceptual diagram of physical processes for contaminant transport for an above-grade waste disposal embankment, responsive to UAC R313-25-8 (1).

CT Processes in the Cover

Geochemical Processes

- solubility
- K_d (soil:water)
- K_H (water:air)

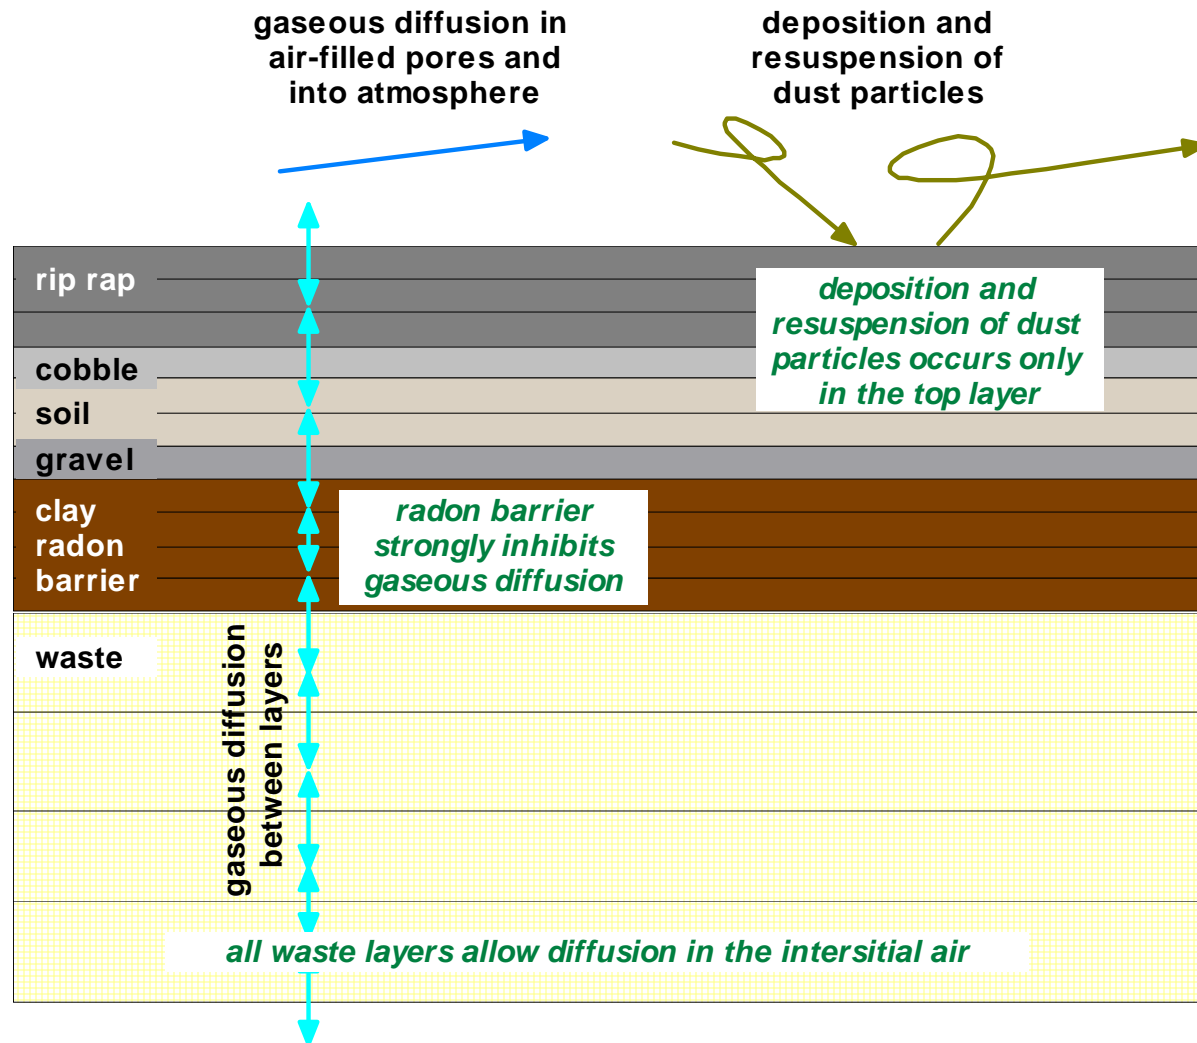

Plant Uptake and Redistribution

Animal Burrowing

Near-Field Airborne Transport

Abstracted Near-Field Model

Groundwater Pathways

Near-Field:

groundwater transport to monitoring wells for comparison to groundwater protection limits (GWPLs)

Far-Field:

no endpoints

Groundwater is Class IV saline and nonpotable. Comparison to thresholds is not performed in the context of possible human exposures.

Contaminant Transport Mechanisms: Far-Field

Far-Field CT Mechanisms

The only transport mechanism for far-field exposures is atmospheric dispersion.

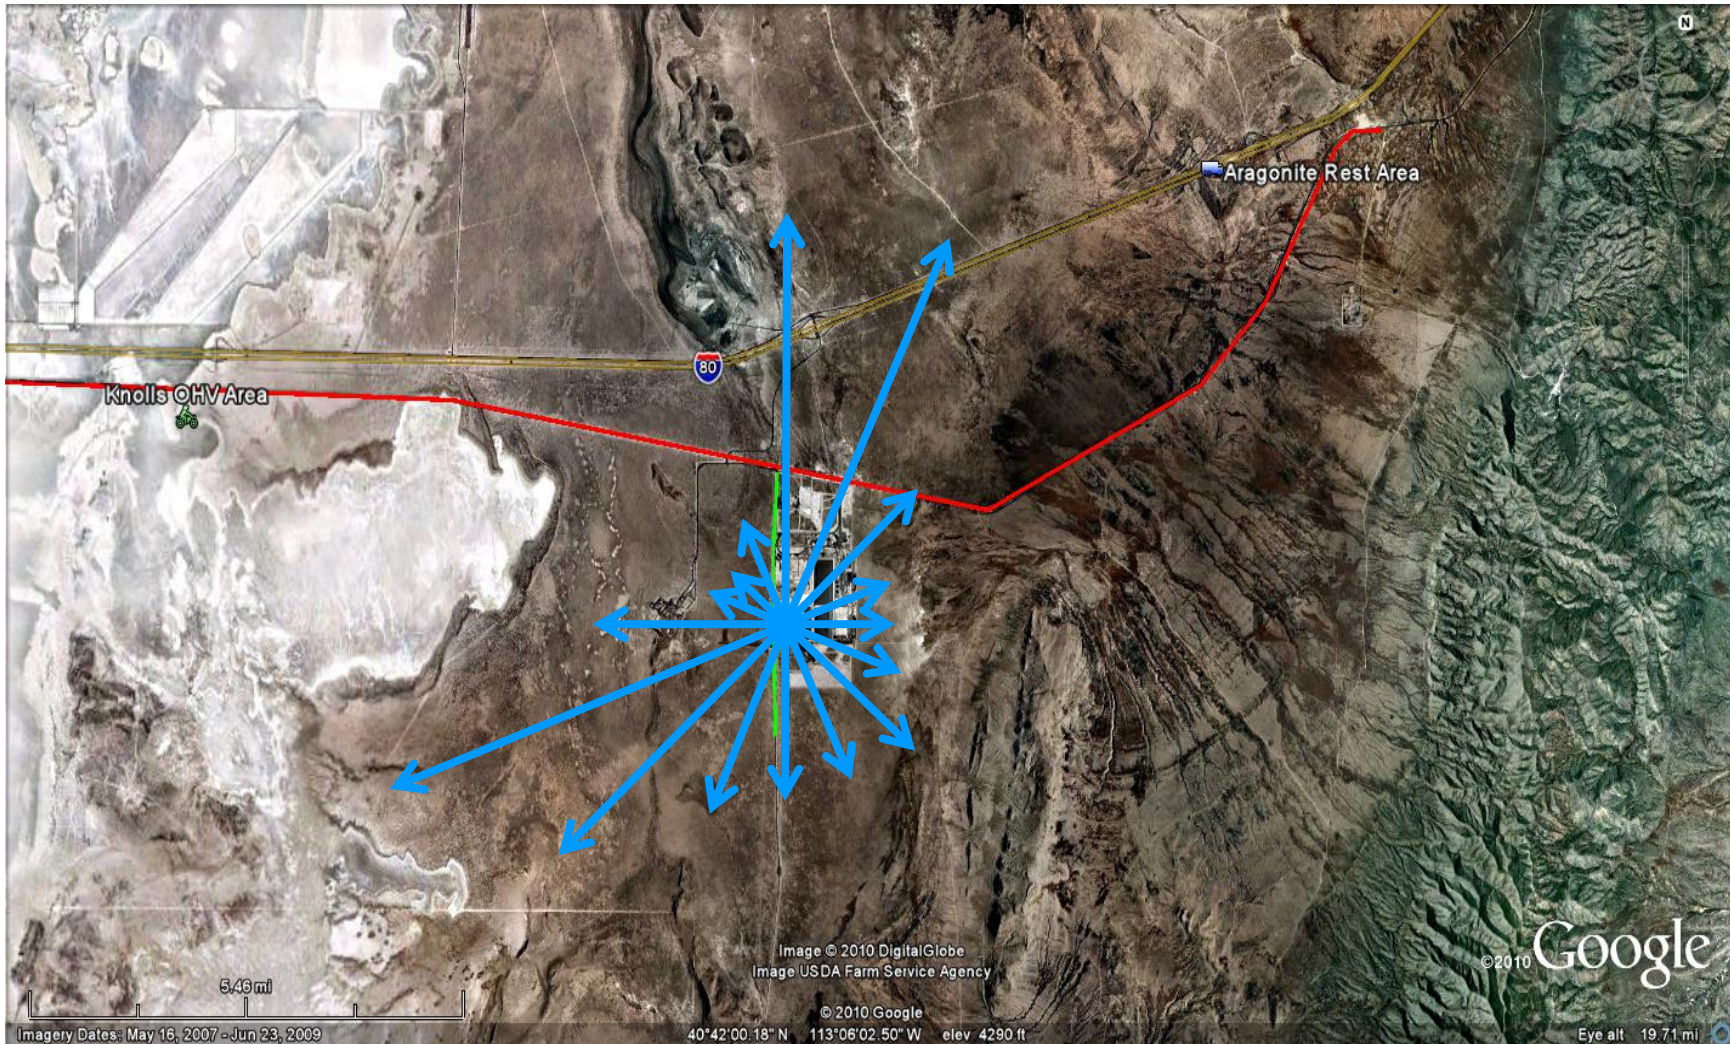

WIND SPEED
(m/s)

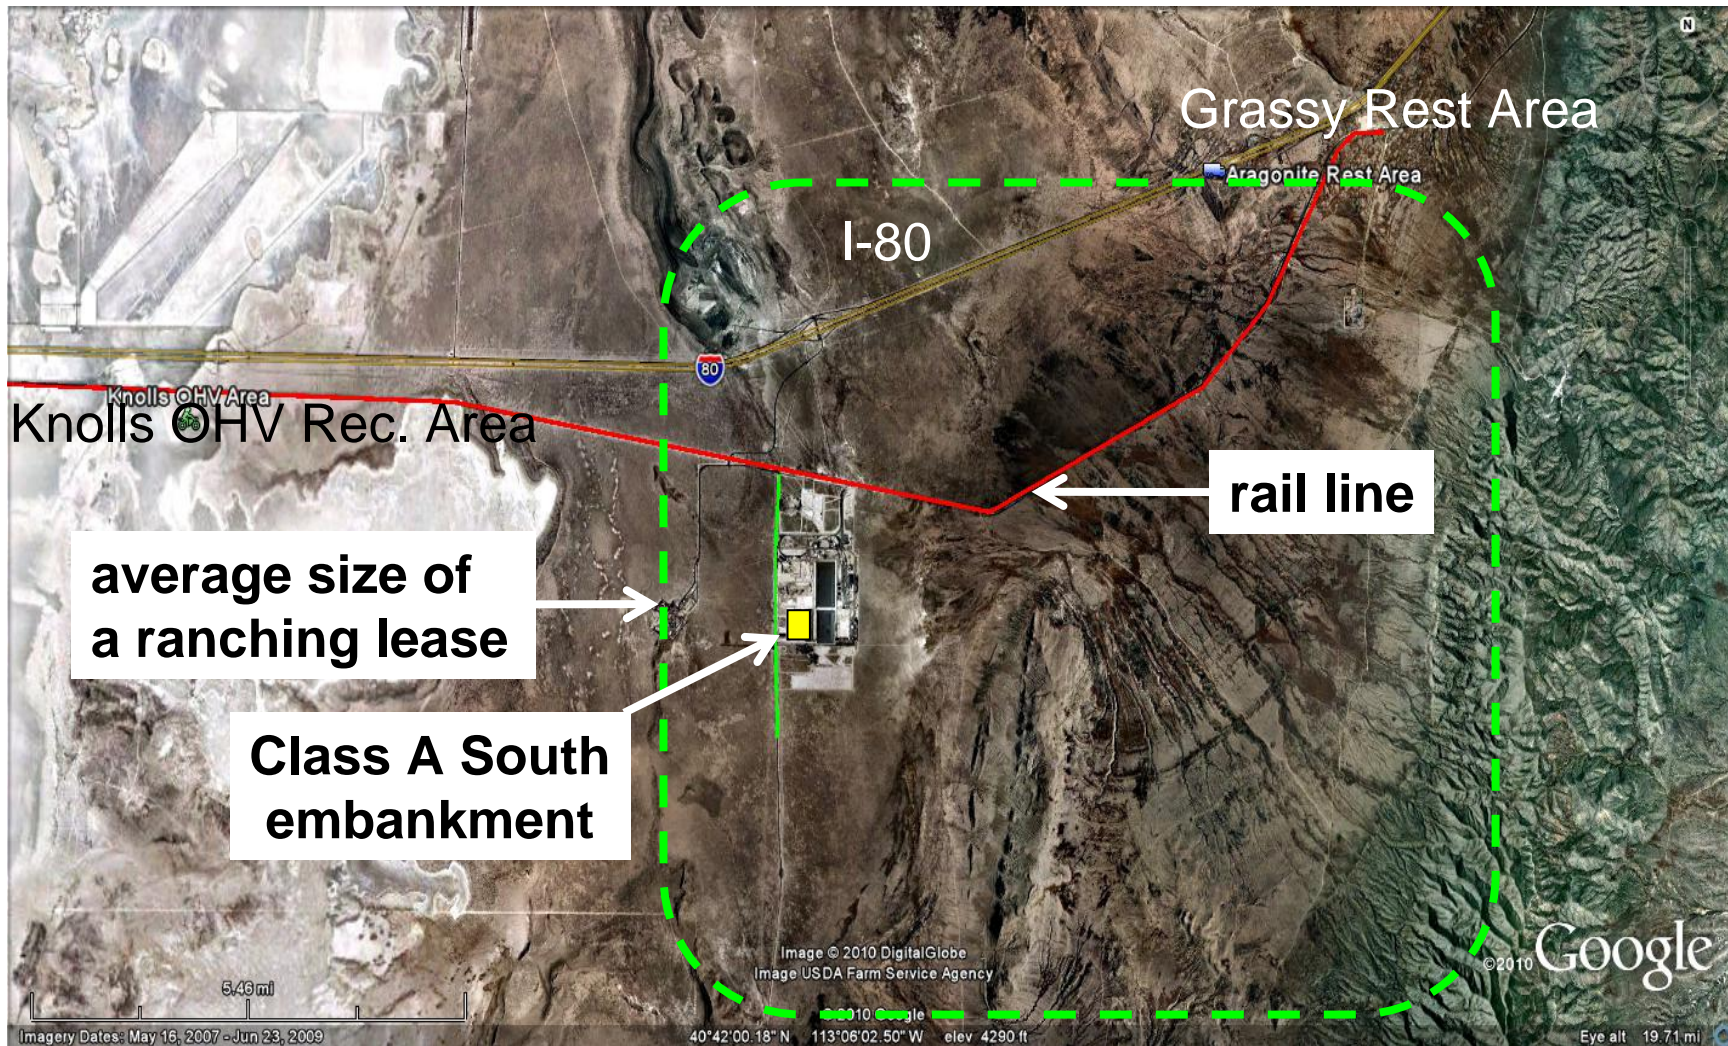

Calms: 0.88%

Atmospheric Dispersion

Exposure Assessment

Dose Assessment Locations

Dose Assessment Scenarios

RANCHING

- Check/repair fencing
- Herding
- Calving / weaning
(typically by 4WD)

RECREATION

- Riding OHVs
- Hunting
- Wild horse viewing
- Camping

Ranching Scenario

Exposure Pathways

Inhalation:

- Wind-derived dust
- Mechanically-created dust
- Radon gas

Ingestion:

- Soil
- Livestock

External Radiation:

- Soil
- Air

Recreation Scenario

Exposure Pathways

Inhalation:

- Wind-derived dust
- Mechanically-created dust
- Radon gas

Ingestion:

- Soil
- Game meat

External Radiation:

- Soil
- Air

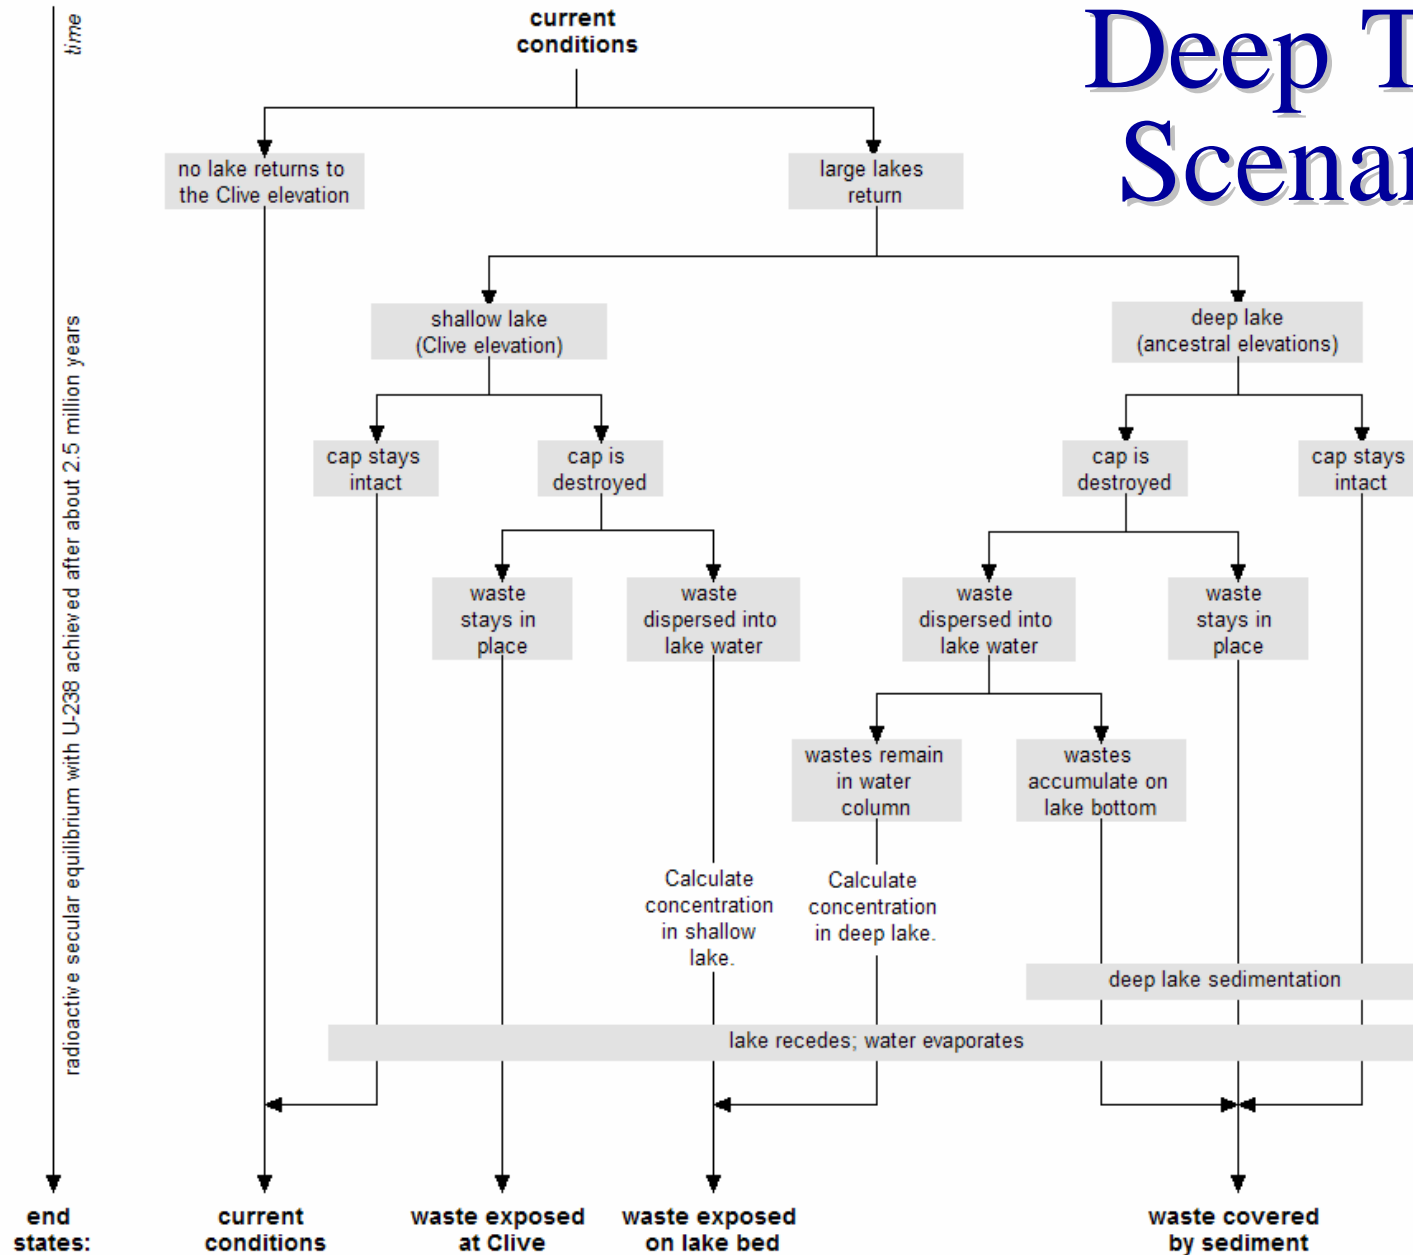

Dose Assessment Calculations

Example: external soil dose

$$\text{Dose} = \underbrace{\text{soil concentration}}_{\substack{\text{transport} \\ \text{model} \\ \text{activity / mass}}} \times \underbrace{\text{daily time} \times \text{frequency}}_{\substack{\text{exposure} \\ \text{model} \\ \text{year (fraction)}}} \times \underbrace{\text{dose factor}}_{\substack{\text{dosimetry} \\ \text{model} \\ \text{dose/year per} \\ \text{activity/mass}}}$$

Deep Time Scenarios

Deep Time Scenarios

Deep Time Scenarios

Possible future events:

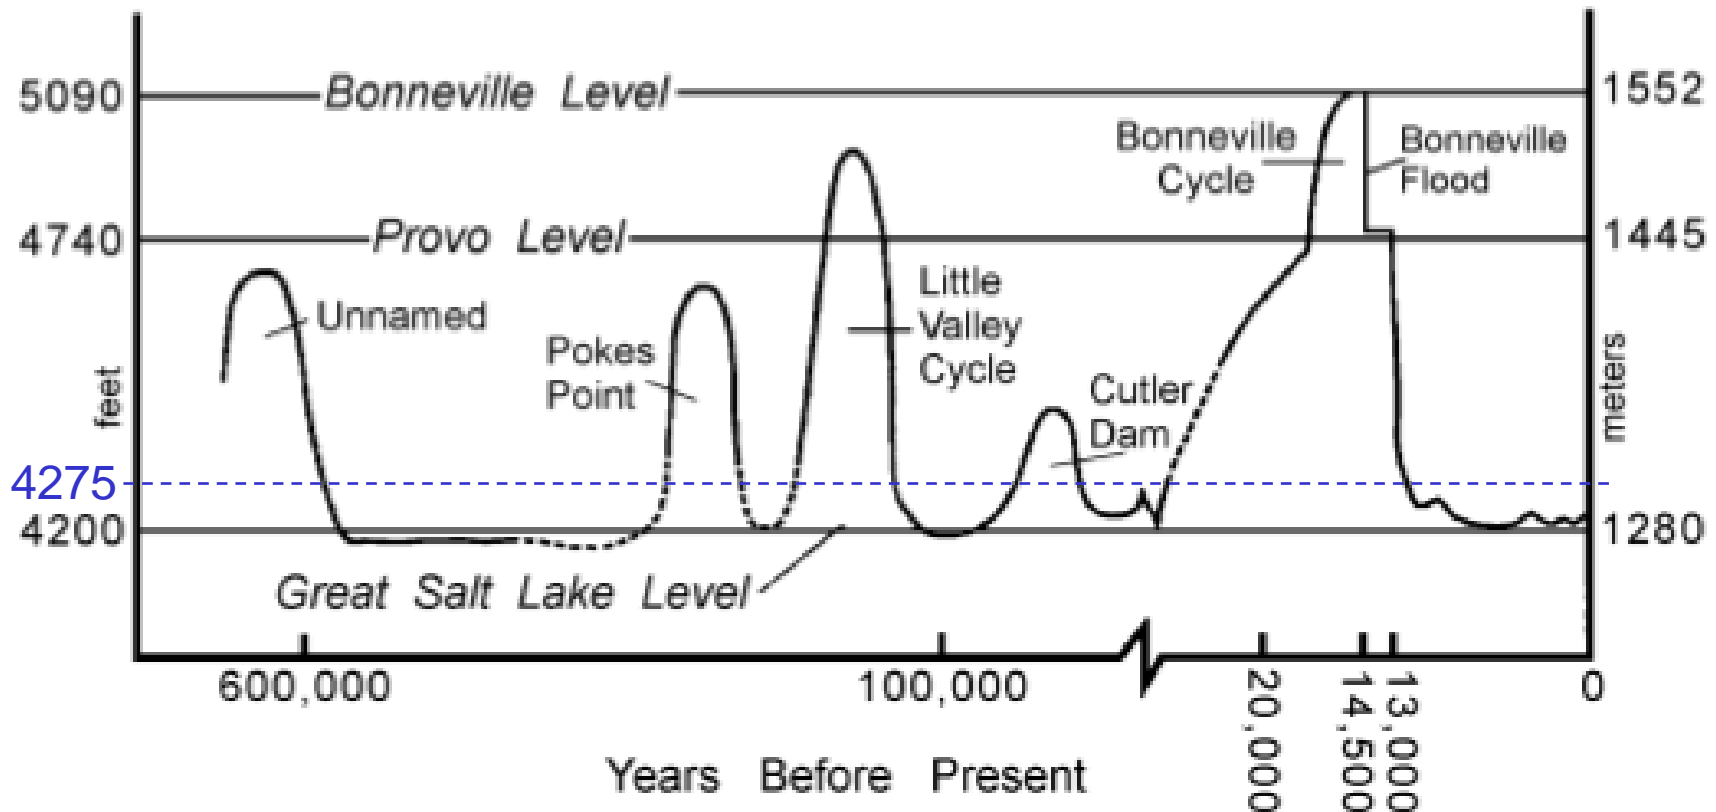

- Large lake inundates Clive
(and Salt Lake City)
- Large lake returns to the elevation of Clive
- No large lake reaches that elevation

Pluvial Lakes in the Great Basin

Pluvial lake: a land locked basin that fills with water during times of glaciation (e.g., Lake Bonneville and its predecessors)

- They typically form when warm air from arid regions meets chilled air from glaciers. This creates cloudy, cool, rainy weather beyond the terminus of the glacier.
- Accumulated sediments show the variation in historical water levels and record the previous lake cycles (e.g. Oviatt *et al.*, 1999).

Ancient History of Lakes

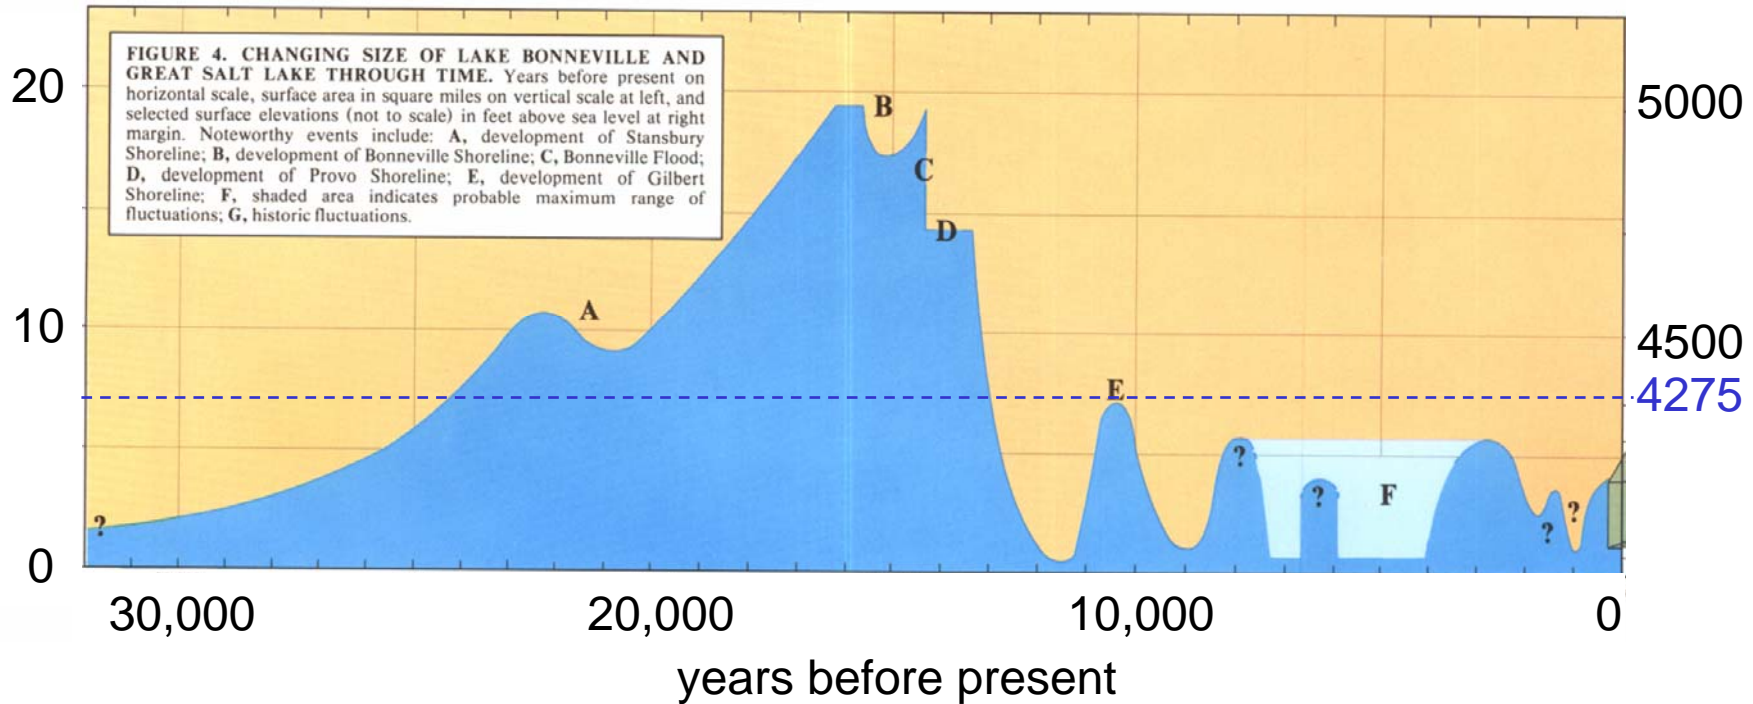

from Link, P.K., D.S. Kaufman, and G.D. Thackray, (1999). *Field guide to Pleistocene Lakes Thatcher and Bonneville and the Bonneville Flood, southeastern Idaho*, in: Hughes, S.S. and G.D. Thackray (eds.), *Guidebook to the Geology of Eastern Idaho*, Idaho Museum of Natural History, pp. 251-266.

Recent History of Lakes

lake area
(1000 mi²)

surface elev.
(ft amsl)

from Utah Geological and Mineral Survey (1984): *Map73 Major Levels of Great Salt Lake and Lake Bonneville*

Future Lake Implications

In the event of a large lake returning:

- Cover (current design) might not survive.
- Waste might be dispersed.
- The lake will deposit sediment.

The issues of how deep the lake would be, and how often it may recur may not influence the outcome very much.

Thank You
