I. Purpose
The following is to be used as a guide to establish and encourage uniform management of used asphalt throughout the State, and to establish the framework under which asphalt is regulated. This guidance is not a rule. It has been prepared to give the reader information, in plain language, about how the Division of Waste Management and Radiation Control expects to interpret Rule R315-315-9. In the event questions arise regarding the matters discussed in this guidance, the text of the rule will govern.

II. Background
Disposal of asphalt in Utah has been and continues to be of concern to the local health departments, the State, and the asphalt paving industry. Limited testing of waste asphalt in Utah has not revealed the material to be hazardous waste. Asphalt, however, is not an inert waste and cannot be used as inert fill.

III. Definition
Solid waste is defined in Utah Code Annotated (Utah Code Ann.) 19-6-102(19), which reads as follows:

(a) "Solid waste" means garbage, refuse, sludge, including sludge from a waste treatment plant, water supply treatment plant, or air pollution control facility, or other discarded material, including solid, liquid, semi-solid, or contained gaseous material resulting from industrial, commercial, mining, or agricultural operations and from community activities.
(b) "Solid waste" does not include solid or dissolved materials in domestic sewage or in irrigation return flows or discharges for which a permit is required under Title 19, Chapter 5, Water Quality Act, or under the Water Pollution Control Act, 33 U.S.C. Sec. 1251 et seq.
(c) "Solid waste" does not include metal that is:
(i) purchased as a valuable commercial commodity; and
(ii) not otherwise hazardous waste or subject to conditions of the federal hazardous waste regulations, including the requirements for recyclable materials found at 40 C.F.R. 261.6.

Asphalt is not inert and therefore does not fall under the exclusions found in Utah Code Ann. 19-6-102.1 and must be treated as a solid waste.
Asphalt has been included in the list of wastes that make up construction and demolition waste. The definition of construction and demolition waste found in Utah Code Ann. R315-301-2(17) reads as follows:

(17) "Construction/demolition waste" means solid waste from building materials, packaging, and rubble resulting from construction, remodeling, repair, abatement, rehabilitation, renovation, and demolition operations on pavements, houses, commercial buildings, and other structures, including waste from a very small quantity generator of hazardous waste, as defined by Section R315-260-10, that may be generated by these operations.

(a) Such waste may include:
   (i) concrete, bricks, and other masonry materials;
   (ii) soil and rock;
   (iii) waste asphalt;
   (iv) rebar contained in concrete; and
   (v) untreated wood, and tree stumps.

(b) Construction/demolition waste does not include:
   (i) friable asbestos;
   (ii) treated wood; or
   (iii) contaminated soils or tanks resulting from remediation or clean-up at any release or spill.

IV. Disposal

Disposal of nonhazardous solid waste is regulated under Utah Code Ann. 19-6-105(l)(a), 19-6-108(3) and R315-301 through 320 of the Utah Administrative Code. Disposal of solid waste must take place in an approved solid waste facility.

Under the above referenced statute, the Director has established the Solid Waste Permitting and Management Rules in R315-301 through 320 of the Utah Administrative Code. Under these rules, facilities accepting for disposal solid waste, including asphalt, are required to have a permit from the Director of the Division of Waste Management and Radiation Control.

Permitted Class I, II, III, IV, V, and VI landfills may receive asphalt when not restricted by specific conditions of the permit. In addition to the disposal restrictions set by the rules and permit conditions, each landfill may set its own waste acceptance policy and may reject wastes that do not fall within the policy.

V. Recycling

Recycling is not disposal and no permit is required from the Division of Waste Management and Radiation Control. However, facilities conducting recycling activities may need to submit a plan of operation to the Division Director. Where plans of operation are required, they must be determined complete by the Director prior to operation of the recycling facility.

Recycling of asphalt occurs when it is used as a feedstock in the manufacture of new hot or cold mix, when used as underlayment or subgrade in road construction (provided the asphalt is not in contact with surface water or ground water), or when it is used under parking lots or structures (provided the asphalt is not in contact with water). Use of waste asphalt as road shoulder is also recycling when the use meets engineering requirements.

Use of asphalt as a fill material in road construction, when it is in contact with surface or ground water or as fill for any other purpose constitutes disposal and is subject to the solid waste disposal regulations.
