Mr. Dane L. Finerfrock Executive Secretary Utah Radiation Control Board State of Utah Department of Environmental Quality 168 North 1950 West Salt Lake City, UT 84114-4850

# Re: Transmittal of 3<sup>nd</sup> Quarter 2006 Chloroform Monitoring Report for the White Mesa Uranium Mill

Dear Mr. Finerfrock:

Enclosed are two copies of the White Mesa Uranium Mill Chloroform Monitoring Report for the 3<sup>nd</sup> quarter of 2006, as required under State of Utah Notice of Violation and Groundwater Corrective Action Order UDEQ Docket No. UGQ-20-01.

Yours truly,

Steven D. Landau Manager, Environmental Affairs

# **Chloroform Monitoring Report**

State of Utah Notice of Violation and Groundwater Corrective Action Order UDEQ Docket No. UGQ-20-01

# 3<sup>rd</sup> Quarter (July through September) 2006

Prepared by:

INTERNATIONAL URANIUM (USA) CORPORATION 1050 17<sup>th</sup> Street, Suite 950 Denver CO 80265

October 30, 2006

# 1. INTRODUCTION

This is the Quarterly Chloroform Monitoring Report, as required under State of Utah Notice of Violation and Groundwater Corrective Action Order State of Utah Department of Environmental Quality ("UDEQ") Docket No. UGQ-20-01 for the 3rd quarter of 2006 (the "Quarter") for International Uranium (USA) Corporation's ("IUSA's") White Mesa Uranium Mill (the "Mill"). This Report also includes the Operations Report for the Long Term Pump Test at MW-4, TW4-19, TW4-15 (MW-26) and TW4-20 for the Quarter.

# 2. SAMPLING AND MONITORING PLAN

# 2.1. Description of Monitor Wells Sampled During the Quarter

During the Quarter, the following chloroform contaminant investigation groundwater samples and measurements were taken:

### 2.1.1. Groundwater Monitoring

Groundwater Monitoring was performed in all of the chloroform monitoring wells, being the following wells:

- MW-4
- TW4-A
- TW4-1
- TW4-2
- TW4-3
- TW4-4
- TW4-5
- TW4-6
- TW4-7
- TW4-8
- TW4-9
- TW4-10

- TW4-11
- TW4-12
- TW4-13
- TW4-14
- TW4-15 (MW-26)
- TW4-16
- TW4-17 (MW-32)
- TW4-18
- TW4-19
- TW4-20
- TW4-21
- TW4-22

The locations of these wells are indicated on the map attached under Tab A.

Each of these wells was sampled for the following constituents on July 20, 2006:

- Chloroform
- Chloromethane
- Carbon tetrachloride
- Methylene chloride
- Chloride
- Nitrogen, Nitrate + Nitrite as N

As UDEQ is aware, IUSA has experienced difficulty in obtaining chloroform samples from well TW4-14. The difficulty arises from the very limited recovery rate encountered at that location. More specifically, it is necessary that there be at least 1.5 feet of water within the well in order to obtain a sample which is not influenced by sedimentation from the bottom of the well. At the request of UDEQ, the recovery rate from the TW4-14 location has been recently evaluated by bailing and routine water level measurements in order to determine the necessary time between purging and sample collection. This evaluative effort was designed to examine a purging schedule for TW4-14 which will allow enough time to be able to collect a sample for the quarterly sampling round. Accordingly, on September 21, 2006 the sample technician purged TW4-14 by bailer. The pre-bailing water level within the well was 91.85 ft below the measuring point. After bailing, the depth-to-water had dropped 1.65 ft to 93.5 ft below the measuring point. However, recovery continued to be slow and by October 20, 2006 the water level had only risen about one foot to 92.55 ft below the measuring point. It is IUSA's hope that the well will rise an additional <sup>1</sup>/<sub>2</sub> foot by the time 4<sup>th</sup> Quarter sampling is completed next month.

# 2.1.2. Groundwater Head Monitoring

Depth to groundwater was taken in the following wells and/or piezometers during the Quarter:

- a) All of the chloroform contaminant investigation wells listed in paragraph 2.1.1 above on July 19,;
- b) The following point of compliance monitoring wells under the Mill's Groundwater Discharge Permit ("GWDP") during the period September 13 to September 18, 2006: MW-1, MW-2, MW-3, MW-3A, MW-5, MW-11, MW-12, MW-14, MW-15, MW-17, MW-18, MW-19, MW-23, MW-24, MW-25, MW-26, MW-27, MW-28, MW-29, MW-30, MW-31 and MW-32;
- c) Piezometers P-1, P-2, P-3, P-4 and P-5 on September 19, 2006; and
- d) Existing monitoring wells MW-20 and MW-22 on September 19, 2006.

In addition, weekly depth to groundwater was taken in MW-4, TW4-15 (MW-26), TW4-19 and TW4-20, as part of the long term pumping test for MW-4.

# 2.2. Sampling Methodology, Equipment and Decontamination Procedures

The sampling methodology, equipment and decontamination procedures that were performed for the chloroform contaminant investigation during the Quarter can be summarized as follows:

- 2.2.1. <u>Well Purging and Depth to Groundwater</u>
  - a) A list is gathered of the wells in order of increasing chloroform contamination. The order for purging is thus established. Mill personnel start purging with all of the non-detect wells and then move to the more contaminated wells in order of

chloroform contamination, starting with the wells having the lowest chloroform contamination; and

b) Before leaving the Mill office, the pump and hose are rinsed with de-ionized ("DI") water. Mill personnel then proceed to the first well. Well depth measurements are taken and the two casing volumes are calculated (measurements are made using the same instrument used for the monitoring wells under the Mill's GWDP). The Grundfos pump (a 6 gpm pump) is then lowered to the bottom of the well. Purging then begins. At the first well, the purge rate is established for the purging event by using a calibrated 5 gallon bucket. After the evacuation of the first well has been completed, the pump is removed from the well and placed in DI water and rinsed prior to leaving the well area. After the rinsing is completed, the well is capped, and Mill personnel then move to the next well for purging.

# 2.2.2. <u>Sampling</u>

- a) Following the purging of all chloroform investigation wells, the sampling takes place (usually the next morning). Prior to leaving the Mill office to sample, a cooler along with blue ice is prepared. The trip blank is also gathered at that time (the trip blank for these events is provided by the Analytical Laboratory). Once Mill Personnel arrive at the well sites, labels are filled out for the various samples to be collected. All personnel involved with the collection of water and samples are then outfitted with rubber gloves;
- b) Mill personnel use a disposable bailer to sample each well. The bailer is attached to a reel of approximately 150 feet of nylon rope and then lowered into the well. After coming into contact with the water, the bailer is allowed to sink into the water in order to fill. Once full, the bailer is reeled up out of the well and the sample bottles are filled as follows;
  - (i) First, a set of VOC vials is filled. This set consists of three 40 ml vials provided by the Analytical Laboratory. The set is not filtered and is preserved with HCL;
  - (ii) Second, a 500 ml sample is collected for Nitrates/Nitrites. This sample is also not filtered and is preserved with H2SO4 (the bottle for this set is also provided by the Analytical Laboratory);
  - (iii) Third, a 500 ml sample is collected for Chloride. This sample is not filtered and is not preserved; and
- c) After the samples have been collected for a particular well, the bailer is disposed of and the samples are placed into the cooler that contains blue ice. The well is then recapped and Mill personnel proceed to the next well.

This manner of sampling has been employed by Mill personnel for chloroform contaminant investigation sampling, including for split sampling undertaken with UDEQ personnel, since the inception of the chloroform contaminant investigation.

IUSA has completed (and transmitted to UDEQ on May 25, 2006) a revised Quality Assurance Plan ("QAP") for sampling under the Mill's GWDP. The GWDP QAP has been reviewed by UDEQ and draft (email) comments from DEQ were received by IUSA on Oct 18, 2006. Subsequent to receipt of UDEQ's comments, IUSA has committed to respond to these comments by November 20, 2006. The QAP provides a more detailed presentation of procedures utilized for groundwater sampling activities under the GWDP. While the water sampling conducted for chloroform investigation purposes is conformant with the general principles set out in the QAP, it does not conform to all the requirements in the QAP. Once the GWDP QAP is finalized and approved by UDEQ it will be evaluated to determine to what extent it should also apply to the chloroform investigation monitoring.

# 2.3 Field Data Worksheets

Attached under Tab B are copies of all Field Data Worksheets that were completed during the Quarter for the chloroform contaminant investigation monitoring wells listed in paragraph 2.1.1 above and sampled on July 20, 2006. The Field Data Worksheets for the Quarter do not include all of the information required under the revised GWDP QAP. As mentioned above, the GWDP QAP is intended for application to general groundwater sampling methods and principally those samplings conducted under the GWDP monitoring program. In the case of chloroform monitoring, well purging prior to sampling is accomplished by means of a high-rate Grundfos pump which has been dedicated specifically to the chloroform monitoring program. Due to the high pumping rate of this pump, field data to determine stable conditions cannot be recorded. Instead, water samples are collected subsequent to the initial high-rate purging event, and usually the day after purging. Accordingly, the field data form utilized for groundwater sampling under the GWDP will be modified for chloroform sampling. The chloroform Worksheet will exist as a separate document to accommodate this purging and data recordation difference. As noted above, the GWDP QAP is in the process of review/response under Part 1.H.6 of the Mill's GWDP. Comments from UDEO have been received and a response to those comments is forthcoming, including the separation of chloroform investigation monitoring from the broader GWDP program. Once the GWDP has been finalized and approved by UDEQ, it will be evaluated to determine to what extent it should also apply to the chloroform investigation monitoring.

# 2.4 Depth to Groundwater Sheets

Attached under Tab C are copies of the Depth to Water Sheets for the weekly monitoring of MW-4, TW4-15 (MW-26), TW4-19 and TW4-20 as well as the monthly depth to groundwater monitoring for all of the chloroform contaminant investigation wells. Monthly depth-to-groundwater measurements for July, 2006 are included on the Field Data Worksheets included under Tab B.

# 3. DATA INTERPRETATION

# **3.1.** Interpretation of Groundwater Levels, Gradients and Flow Directions.

# 3.1.1. <u>Current Site Groundwater Contour Map</u>

Included under Tab D is a water table contour map, which provides the location of all of the wells and piezometers listed in item 2.1.2 above for which depth to groundwater was taken during the Quarter, the groundwater elevation at each such well and piezometer, measured in feet above mean sea level, and isocontour lines to delineate groundwater flow directions observed during the Quarter's sampling event. The contour map uses the July 19, 2006 data for the wells listed in paragraph 2.1.2 (a) above, September 13 to September 18 data for the wells listed in paragraph 2.1.2 (b) above, September 19, 2006 data for the piezometers listed in paragraph 2.1.2 (c) above, and September 19, 2006 data for the wells listed in paragraph 2.1.2 (c) above, and September 19, 2006 data for the wells listed in paragraph 2.1.2 (c) above, and September 19, 2006 data for the wells listed in paragraph 2.1.2 (c) above.

Also included under Tab D is a groundwater contour map of the portion of the Mill site where the four chloroform pumping wells are located, with hand-drawn stream tubes, in order to demonstrate hydraulic capture from the pumping

# 3.1.2. <u>Comparison of Current Groundwater Contour Maps to Groundwater Contour</u> <u>Maps for Previous Quarter</u>

The groundwater contour maps for the Mill site for the second quarter of 2006, as submitted with the Chloroform Monitoring Report for the second quarter of 2006, dated July 31, 2006, are attached under Tab E.

A comparison of the water table contour maps for the Quarter to the water table contour maps for the previous quarter indicates similar patterns of drawdown related to pumping of MW-4, TW4-15(MW-26), TW4-19 and TW4-20. Water levels and water level contours for the site have not changed significantly since the last quarter, except there was less drawdown in TW4-20 than in the previous quarter. Fluctuations in water levels in the pumping wells are due in part to fluctuations in pumping conditions just prior to and at the time the measurements are taken

### 3.1.3. <u>Hydrographs</u>

Attached under Tab F are hydrographs showing groundwater elevation in each chloroform contaminant investigation monitor well over time.

### 3.1.4. Depth to Groundwater Measured and Groundwater Elevation

Attached under Tab G are tables showing depth to groundwater measured and groundwater elevation over time for each of the wells listed in Section 2.1.1 above.

# 3.1.5. Evaluation of the Effectiveness of Hydraulic Capture

Perched water containing chloroform has been removed from the subsurface by pumping MW-4, TW4-19, MW-26 (formerly TW4-15), and TW4-20. The purpose of the pumping is to reduce total chloroform mass in the perched zone as rapidly as is practical. These wells were chosen for pumping because 1) they are located in areas of the perched zone having relatively high permeability and saturated thickness, and 2) high concentrations of chloroform were detected at these locations. The relatively high transmissivity of the perched zone in the vicinity of the pumping wells results in the wells having a relatively high productivity. The combination of relatively high productivity and high chloroform concentrations allows a high rate of chloroform mass removal.

The impact of pumping these wells is indicated by the water level contour maps attached under Tabs D and E. Cones of depression have developed in the vicinity of the pumping wells which continue to remove significant quantities of chloroform from the perched zone. The water level contour maps indicate that effective capture of water containing high chloroform concentrations in the vicinity of the pumping wells is occurring. As noted in Section 3.1.2, less drawdown was measured in TW4-20 as compared to the previous quarter. However as defined by drawdowns in nearby, non-pumping wells that serve as observation wells, and that are not strongly affected by short-term fluctuations in individual well pumping rates, the combined capture of TW4-19, TW4-20, and MW-26 has not changed significantly since the last quarter.

Although high chloroform concentrations exist at some locations downgradient of the pumping wells (for example, near TW4-4), the low permeability of the perched zone at these locations would prevent significant rates of chloroform mass removal should these wells be pumped. By pumping at the more productive, upgradient locations, however, the rate of downgradient chloroform migration will be diminished because of the reduction in hydraulic gradients, and natural attenuation will be more effective.

# **3.2.** Interpretation of Analytical Results

# 3.2.1. Copy of Laboratory Results

Included under Tab H of this Report are copies of all laboratory analytical results for the groundwater quality samples collected under the chloroform contaminant investigation on July 20, 2006, along with the laboratory analytical results for a trip blank.

# 3.2.2. Electronic Data Files and Format

IUSA has provided to the Executive Secretary an electronic copy of all laboratory results for groundwater quality monitoring conducted under the chloroform contaminant investigation during the Quarter, in Comma Separated Values (CSV). A copy of the transmittal e-mail is included under Tab I.

# 3.2.3. Current Chloroform Isoconcentration Map

Included under Tab J of this Report is a current chloroform isoconcentration map for the Mill site.

# 3.2.4. Data and Graphs Showing Chloroform Concentration Trends

Attached under Tab K is a table summarizing chloroform and nitrate values for each well over time. TW4-14 continues to be dry (see the discussion in Section 2.1.1 above)

Attached under Tab L are graphs showing chloroform concentration trends in each monitor well over time. As TW4-14 continues to be dry, a trend graph for that well has not been included.

# 3.2.5. Analysis of Analytical Results

Comparing the analytical results to those of the previous quarter, as summarized in the table included under Tab K, the following observations can be made:

- a) Chloroform concentrations have increased by more than 20% in the following wells, compared to last quarter: TW4-1, TW4-2, TW4-10, TW4-15 and TW4-22.
- b) Chloroform concentrations have decreased by more than 20% in the following wells, compared to last quarter: TW4-6, TW4-16, and TW4-20;
- c) Chloroform concentrations have remained within 20% in the following wells compared to last quarter: MW-4, TW4-4, TW4-5, TW4-7, TW4-11, TW4-18, TW4-19, and TW4-21;
- d) Chloroform concentrations at TW4-8 decreased from 1.0 micrograms per/liter  $(\mu g/l)$  to non-detect; and
- e) TW4-3, TW4-9, TW4-12, TW4-13, and TW4-17 (MW-32) remained non-detect.

In addition, the chloroform concentration in recently installed well TW4-20 decreased from 61,000  $\mu$ g/L in the second quarter 2006 to 5,300  $\mu$ g/L in the third quarter 2006 and the concentration in TW4-22 increased from 280  $\mu$ g/L in the second quarter 2006 to 884  $\mu$ g/L in the third quarter 2006. Chloroform concentrations in TW4-6, which is the most downgradient temporary perched well, decreased from 19 to11  $\mu$ g/L. This is the second quarter of reductions in concentrations measured in this well. The decreases in concentration are likely due in part to the reduction in average hydraulic gradients resulting from upgradient pumping which will slow the rate of chloroform migration. Chloroform migration rates in this area are also slow due to low permeability conditions. TW4-14 also continues to be dry.

# **3.3.** Quality Assurance Evaluation And Data Validation

Quality assurance evaluation and data validation procedures in effect at the time of sampling were followed. These involve three basic types of evaluations: field QC checks; Analytical Laboratory checks; and checks performed by IUSA personnel, as described below.

# 3.3.1 Field QC Checks

Field Quality Control samples for the chloroform investigation program consist of a field duplicate sample, a field blank and a trip blank. These check samples are to be generated for each quarterly sampling episode. During the 3<sup>rd</sup> Quarter of 2006 the Mill's Environmental Technician inadvertently failed to collect/prepare these samples. The Environmental Technician has been advised of this failure. In order to prevent a recurrence of this mistake by the Environmental Technician, the Mill's Radiation Safety Officer (RSO) will personally direct appropriate attention to QC sampling during the next sampling event and as necessary in connection with subsequent sampling events.

A trip blank was prepared and sent to the Analytical Laboratory for the July 20, 2006 sampling event.

Rinsate samples are not prepared because a dedicated, single-use disposable bailer is used to sample each well.

# 3.3.1. <u>Analytical Laboratory QA/QC Procedures</u>

The Analytical Laboratory has provided summary reports of the analytical quality assurance/quality control (QA/QC) measurements necessary to maintain conformance with NELAC certification and reporting protocol. The Analytical Laboratory QA/QC Summary Report, including copies of the Mill's Chain of Custody and Analytical Request Record forms, for the July 20, 2006 sampling event, are included under Tab H.

3.3.2. Mill QA Manager Review

The Mill QA Manager, which, for these sampling events was IUSA's Manager of Environmental Affairs, performed three types of reviews: a determination of whether Mill sampling personnel followed Mill sampling procedures; a review of the results from the Field QC Checks; and a review of the Analytical Laboratory QA/QC analysis. The results of the QA Manager's review are discussed below.

a) Adherence to Mill Sampling SOPs

On a review of adherence by Mill personnel to the sampling procedures summarized in Section 2.2 above, the QA Manager concluded that such procedures had been followed with the exception of missing QC check samples indicated above.

# b) Results From Field QC Checks

As stated above, the Mill's Environmental Technician failed to prepare/collect appropriate duplicate and field blank samples for the 3<sup>rd</sup> Quarter. A review of the results of the trip blank did not identify detectable concentrations for measured parameters.

### c) Review of Analytical Laboratory QA/QC Analysis

The QA Manager reviewed the Analytical Laboratory's QA/QC Summary Reports and made the following conclusions;

(i) Check samples were analyzed for each method used in analyzing the Chloroform investigation samples. These methods were:

<u>Parameter</u>	<u>Method</u>
Nitrogen, (Nitrate + Nitrite as N)	E353.2
Chloroform,	E624
Carbon tetrachloride	E624
Chloromethane	E624
Methylene chloride	E624
Chloride	A4500-CL B

- (ii) The check samples included at least the following: a method blank, a laboratory control spike (sample), a matrix spike and a matrix spike duplicate;
- (iii) All qualifiers, if any, and the corresponding explanations in the summary reports are reviewed by the QA Manager. No qualifiers were reported in the QA/QC Summary Reports for any of the check samples for any of the analytical methods;
- (iv) There were no qualifiers reported in the Laboratory Analytical Reports, other than an indication that the Reporting Limit was increased due to sample matrix interference in a number of cases. The sample matrix interference was due to the dilution required in order to analyze for the relatively high concentrations of chloroform and/or nitrate & nitrite. However, because the amounts reported for chloroform and nitrate & nitrite were well in excess of the increased reporting limit in all samples, the fact that the reporting limit was increased in those cases had no practical impact on the analysis of chloroform or nitrate & nitrite. Some of the results for the other parameters analyzed, however, were non-detect at the increased Reporting Limits;
- (v) A review of the surrogate spiked samples for methylene chloride in each sample also showed that the Reporting Limit was increased due to sample

matrix interference in those samples where the Reporting Limit for chloroform was increased, as would be expected.

# 4. LONG TERM PUMP TEST AT MW-4, TW4-15 (MW-26), TW4-19 AND TW4-20, OPERATIONS REPORT

# 4.1. Introduction

As a part of the investigation of chloroform contamination at the Mill site, IUSA has been conducting a Long Term Pump Test on MW-4, TW4-19, TW4-15 (MW-26) and TW4-20. The purpose of the test is to serve as an interim action that will remove a significant amount of chloroform-contaminated water while gathering additional data on hydraulic properties in the area of investigation. The following information documents the operational activities during the Quarter.

# 4.2. Pump Test Data Collection

The long term pump test for MW-4 was started on April 14, 2003, followed by the start of pumping from TW4-19 on April 30, 2003, from TW4-15 (MW-26) on August 8, 2003 and from TW4-20 on August 4, 2005. Personnel from Hydro Geo Chem, Inc. were on site to conduct the first phase of the pump test and collect the initial two days of monitoring data for MW-4. IUSA personnel have gathered subsequent water level and pumping data.

Analyses of hydraulic parameters and discussions of perched zone hydrogeology near MW-4 has been provided by Hydro Geo Chem in a separate report, dated November 12, 2001, and in the May 26, 2004 Final Report on the Long Term Pumping Test.

Data collected during the Quarter included the following:

- a) Measurement of water levels at MW-4, TW4-19, TW4-15 (MW-26), and TW4-20 on a weekly basis, and at selected temporary wells and permanent monitoring wells on a monthly basis (See Section 3.1 and Tabs B and C for a discussion of the water levels);
- b) Measurement of pumping history:
  - (i) pumping rates
  - (ii) total pumped volume
  - (iii) operational and non-operational periods;
- c) Periodic sampling of pumped water for chloroform and nitrate & nitrite analysis and other constituents, as discussed in detail in Section 3.2 above.

# **4.3.** Water Level Measurements

Beginning August 16, 2003, the frequency of water level measurements from MW-4, TW4-15 (MW-26), and TW4-19 was reduced to weekly. From commencement of pumping TW4-20, water levels in that well have been measured weekly. Depth to groundwater in all other chloroform contaminant investigation wells is monitored monthly. Copies of the weekly Depth to Water monitoring sheets for MW-4, TW4-15 (MW-26), TW4-19 and TW4-20 and the August and September monthly Depth to Water monitoring sheets for all of the chloroform contaminant investigation wells are included under Tab C. Monthly depth to water measurements for July are recorded in the Field Data Worksheets included under Tab B.

### 4.4. Pumping Rates and Volumes

# 4.4.1. <u>MW-4</u>

Approximately 99,780 gallons of water were pumped from MW-4 during the Quarter. The average pumping rate from MW-4, when the pump was pumping, was approximately 4.0 gpm throughout the Quarter. The well is not purging continuously, but is on a delay device. The well purges for a set amount of time and then shuts off to allow the well to recharge. Water from MW-4 was transferred to the Cell 1 evaporation pond through a pipeline installed specifically for that purpose. At the end of the 3<sup>rd</sup> Quarter, 2006, and since commencement of pumping on April 14, 2003, an estimated total of approximately 1,176,850 gallons of water have been purged from MW-4.

# 4.4.2. <u>TW4-19</u>

Approximately 633,910 gallons of water were pumped from TW4-19 during the Quarter. The average pumping rate from TW4-19, when the pump was pumping, was approximately 6.0 gpm throughout the Quarter. The pump in this well is operating on a delay. It pumps for approximately one and a half minutes and then is off for two to three minutes. Water from TW4-19 was directly transferred to the Cell 1 evaporation pond through a pipeline installed specifically for that purpose. At the end of the 3<sup>rd</sup> Quarter, 2006, and since commencement of pumping on April 30, 2003, an estimated total of approximately 5,433,346 gallons of water have been purged from TW4-19.

## 4.4.3. <u>TW4-15 (MW-26)</u>

Approximately 32,840 gallons of water were pumped from TW4-15 (MW-26) during the Quarter. The average flow rate from TW4-15, when the pump was pumping, was approximately 1.5 gpm throughout the Quarter. The well is not purging continuously, but is on a delay device. The well now purges for a set amount of time and then shuts off to allow the well to recharge. The water is directly transferred to the Cell 1 evaporation pond through a pipeline installed specifically for that purpose. At the end of the 3<sup>rd</sup> Quarter, 2006, and since commencement of pumping on August 8, 2003, an estimated total of approximately 845,550 gallons of water have been purged from TW4-15.

# 4.4.4. <u>TW4-20</u>

Approximately 80,790 gallons of water were pumped from TW4-20 during the Quarter. The average flow rate from TW4-20, when the pump was pumping, was approximately 6.0 gpm throughout the Quarter. The well is not purging continuously but is on a delay device. The well pump is set on a water elevation device. When the water reaches a set point, the pump turns on until the water level drops to another set point. The water is directly transferred to the Cell 1 evaporation pond through a pipeline installed specifically for that purpose. Since commencement of pumping on August 4, 2005, an estimated total of approximately 382,670 gallons of water have been purged from TW4-20.

# 4.5. Daily Inspections

IUSA has submitted an *Operations and Maintenance Plan, Chloroform Pumping System, White Mesa Mill, Blanding, Utah*, Revision 1.0 to UDEQ for approval. Upon approval of that plan, the Mill will commence documenting its daily inspections of the operational status of the chloroform pumping wells on the daily inspection form, an example of the form of which is attached as Tab M.

# 4.6. **Operational Problems**

The following operational problems were encountered during the Quarter:

- a) At location TW4-15 flow meter problems were experienced in the later part of July and during August. Several flow meters were replaced in response to these difficulties. Also during this quarter a power bump occurred due to installation of equipment in the milling facility (barrel crusher). This resulted in approximately one week of power loss to the well. It has also been noted that the pump at this location is experiencing a lessened pumping rate and will need replacement soon.
- b) As was the case for TW4-15, TW4-20 also experienced flow meter problems in the later part of July and during August. Here too, several flow meters were replaced in response to the flow meter defects.

# 4.7. Conditions That May Affect Water Levels in Piezometers

No water was added to any of the three wildlife diversion ponds during the Quarter.

# 4.8. Chloroform Analysis

Monthly chloroform sampling ceased on November 8, 2003. From that time all chloroform contaminant investigation wells were sampled on a quarterly basis. During the Quarter, samples from MW-4, TW4-19, TW4-15 (MW-26) and TW4-20 were taken

from a small valve and tee placed in the discharge line downstream from the pump control valve for each well. The sample results are discussed above in Section 3.2.

# 5. CONCLUSIONS AND RECOMMENDATIONS

The water level contour map for the Quarter indicates that effective capture of water containing high chloroform concentrations in the vicinity of the pumping wells is occurring.

The chloroform concentration in recently installed temporary well TW4-20 decreased from 61,000 to 5,300  $\mu$ g/L between the second quarter of 2006 and the third quarter of 2006. This fluctuation in concentration is likely related to variations in pumping in this well and nearby wells, and its location immediately downgradient of the suspected former office leach field source area. The increase in chloroform in TW4-22 from 280 to 884  $\mu$ g/L between the second and third quarters of 2006 is also likely related to changes in nearby pumping rates and its location close to the suspected source area. Regardless of these measured fluctuations in chloroform concentrations, pumping TW4-20 helps to reduce downgradient chloroform migration by removing chloroform mass and reducing average hydraulic gradients, thereby allowing natural attenuation to be more effective. Continued pumping of wells that are currently pumping is recommended.

The decrease in chloroform concentrations at downgradient well TW4-6 from 19 to  $11 \mu g/L$  is consistent with the generally slow migration of chloroform to the south in this area, and the impact of upgradient pumping. Migration rates in this area are low primarily due to low-permeability conditions, although the overall rate of chloroform migration is also slowed as a result of pumping at upgradient locations. Upgradient pumping likely contributed to the measured decrease in TW4-6 chloroform concentrations since the last quarter.

## Water Levels and Data over Time White Mesa Mill - Well TW4-22

# SECTION H

## ANALYTICAL SUMMARY REPORT

August 16, 2006

David Turk International Uranium (USA) Corp 6425 S Hwy 191 PO Box 809 Blanding, UT 84511

Workorder No.: C06070960

Project Name: 3rd Quarter Chloroform Sampling

Energy Laboratories, Inc. received the following 24 samples from International Uranium (USA) Corp on 7/21/2006 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive D	ate Matrix	Test
C06070960-001	TW4-1	07/20/06 13:05	07/21/06	Aqueous	Chloride Nitrogen, Nitrate + Nitrite E624 Purgeable Organics
C06070960-002	TW4-2	07/20/06 14:00	07/21/06	Aqueous	Same As Above
C06070960-003	TW4-3	07/20/06 07:33	07/21/06	Aqueous	Same As Above

## **CASE NARRATIVE**

### THIS IS THE FINAL PAGE OF THE LABORATORY ANALYTICAL REPORT

#### **BRANCH LABORATORY LOCATIONS**

eli-b - Energy Laboratories, Inc. - Billings, MT eli-f - Energy Laboratories, Inc. - Idaho Falls, ID

eli-g - Energy Laboratories, Inc. - Gillette, WY

eli-h - Energy Laboratories, Inc. - Helena, MT

eli-r - Energy Laboratories, Inc. - Rapid City, SD

eli-t - Energy Laboratories, Inc. - College Station, TX

### ORIGINAL SAMPLE SUBMITTAL(S)

All original sample submittals have been returned with the data package. A copy of the submittal(s) has been included and tracked in the data package.

#### SUBCONTRACTING ANALYSIS

Subcontracting of sample analyses to an outside laboratory may be required. If so, ENERGY LABORATORIES will utilize its branch laboratories or qualified contract laboratories for this service. Any such laboratories will be indicated within the Laboratory Analytical Report.

#### SAMPLE TEMPERATURE COMPLIANCE: 4°C (±2°C)

Temperature of samples received may not be considered properly preserved by accepted standards. Samples that are hand delivered immediately after collection shall be considered acceptable if there is evidence that the chilling process has begun.

ENERGY LABORATORIES, INC. - CASPER, WY certifies that certain method selections contained in this report meet requirements as set forth by NELAC. Some client specific reporting requirements may not require NELAC reporting protocol. NELAC Certification Number E87641.

#### PCB ANALYSIS USING EPA 505

Data reported by ELI using EPA method 505 reflects the results for seven individual Aroclors. When the results for all seven are ND (not detected), the sample meets EPA compliance criteria for PCB monitoring.

ELI appreciates the opportunity to provide you with this analytical service. For additional information and services visit our web page www.energylab.com.

The total number of pages of this report are indicated by the page number located in the lower right corner.

To: 'dfinerfrock@utah.gov'

Subject: White Mesa Mill 3rd Quarter 2006 Chloroform Monitoring Results

Attachments: C06070960.csv

Dear Mr. Finerfrock,

Attached to this email is an electronic copy of all laboratory results for chloroform monitoring conducted during the Quarter, in Comma Separated Value (CSV) format.

Yours truly,

Steven D. Landau Manager, Environmental Affairs International Uranium (USA) Corporation 1050 17<sup>th</sup> Street, Suite 950 Denver, CO. 80265

Telephone: (303) 398-4132 Fax: (303) 389-4125
