FACILITY CONTACTS

Person Name: Jeff Hiatt

Position: Plant Superintendent

Person Name: Tyler Lowe Position: Operator

Phone Number: (801) 465-5277

Facility Name: Payson City Wastewater Treatment Plant

Mailing Address: 439 West Utah Ave

Payson City, Utah 84651

Telephone: (801) 465-5277

Actual Address: 1062 North Main St.

DESCRIPTION OF FACILITY

The Payson City Wastewater Treatment Plant (Payson) is located at 1062 North Main, Payson City, Utah and serves the City of Payson. The State of Utah Storet number is 499541. The population of the City is approximately 20,000. The design flow of the facility is 3.0 MGD average daily flow with a peak flow of 4.5 MGD.

The influent enters the plant through a 30" Parmer Bowlus flume. The headworks contain two (2) 30" step screens followed by rag washers for each screen. The headworks also contain an 8 ft diameter vortex grit removal system with an air lift pump to a grit washer. The wastewater is then pumped to the 70 ft diameter Primary Clarifier followed by the 102 ft diameter primary trickling filter (Rock Media Volume = 57,200 ft³). The primary pump station has a capacity of 0.5-7.0 MGD with one standby pump.

The flow then enters the secondary pump station where the wastewater is pumped to one of two 45 ft diameter intermediate clarifiers. The secondary pump station has a capacity of 0.5-6.5 MGD with one standby pump. After leaving the intermediate clarifiers, the flow enters the STM Aerotors. In July 2002, a rectangular tank (92.5 ft x 49.5 ft x 16 ft) fitted with eight (8) STM Aerotors was brought on-line, replacing the secondary trickling filters which were taken off-line to be converted to aeration basins. The aeration basins were only to be used during the cherry processing season, July through September. The flow would leave the intermediate clarifiers, enter the aeration basins, and then flow back to the aerotor tank. Throughout the remainder of the year, the aeration basins would be off-line, and the flow leaving the

intermediate clarifiers will directly enter the aerotor tank. Currently one of the aeration basins is back online and will be in use until construction is complete.

After leaving the aerotor tank, the process water will enter one of two final clarifiers with diameters of 45 ft and 60 ft. Following the final clarifiers, the flow is directed through 2-shallow bed, traveling bridge rapid sand filters followed by a chlorine contact basin having a sixty (60) minute detention time in the chlorine contact basin and then discharged through Outfall 001.

Payson has three (3) anaerobic digesters. Each digester is 40 ft in diameter with a total digester volume of 91,471 ft³. Payson City has nine (9) drying beds. The first five drying beds have an area of 5000 ft² each. The remaining four drying beds have a combined area of 16,150 ft². The biosolids are removed from the drying beds and sent to the landfill. Approximately 250 metric tons of dry biosolids are produced each year by the facility.

The 2017 renewal permit included provisions covering the reuse of the effluent. For the 2017 renewal permit, a new WLA model was calibrated and used and a reasonable potential analysis (RP) was conducted. As a result, limits for ammonia and residual chlorine were modified, limits for selenium, mercury, and cyanide were added and the monitoring requirements were increased. Consistent with DWQ and EPA policy, a limit on flow was included in the permit. DWQ completed an update WET Policy, which resulted in some changes to the WET requirements in the Permit.

To allow time for Payson to come into compliance with the new effluent limits and the Technology-Based Phosphorus Effluent Limit (TBPEL) Rule (UAC R317-1-3.3) DWQ adopted in 2014, DWQ issued a Variance and added a compliance schedule in the permit.

SUMMARY OF CHANGES FROM PREVIOUS PERMIT

Minor issues with the Reuse requirements were identified after the issuance of the renewal permit. The permit was modified to correct them, then public noticed and singed.

Over the past permit term Payson has had problems staying in compliance with the WQBEL for cyanide in the effluent. After completing the RP for cyanide, it was determined that, Payson will be required to monitor for both free and total cyanide twice per month. The limit will be change from total cyanide to free cyanide.

In support of future TMDL work to be conducted on impaired downstream waters, monitoring for total dissolved solids (TDS) is being added to the permit.

The city will be upgrading and replacing almost all the processes at the plant during the permit cycle in order to meet the capacity requirements of ongoing development and growth, as well as the more stringent limits related to reduced instream flows. To prepare for this they applied for a renewal permit at an increased flow rate, and submitted a Level II Antidegradation Review (L2ADR) to demonstrate they will be using the least degrading technology.

This increased flow, along with refinements in the WLA Model, and decreasing flows in the receiving stream resulted in more stringent limits for Payson. The Renewal Application and L2ADR are included in the FSSOB in Attachment 5. Since Payson will not be able to comply with all the effluent limits until they have completed the upgrades, the previous permits limit will remain as interim limits until the construction is complete.

Global events during the previous permit cycle resulted in delays in the completion of the facility upgrades required to come into compliance with the new permit effluent limits and TBPEL rule. To allow more time for Payson to come into compliance with the new permit requirements the compliance schedule and variance were extended. The deadline will now be extended to December 31, 2026.

The requirements on the Variance and Compliances Schedule are extended until the December 31, 2026 deadline. Full compliance is expected on January 1, 2027. The requirements for the TBPEL, Ammonia, Disinfection System compliance schedule are below, completed items are noted as complete:

| eetion System compilar | ce senedule die below, completed hems die noted as complete. |
|------------------------|--|
| May 1, 2019 | Submit to DWQ a City Council resolution supporting the pursuit of the facility upgrade for the selected biological phosphorus and ammonia removal technology. The resolution shall include the approximate budget for the facility upgrade. If Payson is not pursuing a biological phosphorus removal technology the TBPEL variance will terminate, final limits for ammonia and TRC will continue as per the effluent limits table below. (Completed) |
| July 1, 2019 | Submit to DWQ an annual report relating to its phosphorus discharges as detailed in the TBPEL Variance. (Completed) |
| December 1, 2019 | Submit to DWQ a complete Capital Facilities Plan with the recommended biological phosphorus, ammonia removal technology and disinfection system. (Completed) |
| July 1, 2020 | Submit to DWQ an annual report relating to its phosphorus discharges as detailed in the TBPEL Variance. (Completed) |
| January 1, 2021 | Submit to DWQ documentation of financial planning for the required facility upgrades. In addition, if rate increases are necessary Payson shall have passed the required rate increase resolution by no later than January 1, 2021. (Completed) |
| July 1, 2021 | Submit to DWQ an annual report relating to its phosphorus discharges as detailed in the TBPEL Variance. (Completed) |
| January 1, 2022 | Submit to DWQ an approvable complete construction permit application for new facilities to meet permit effluent limit requirements. (Completed) |
| July 1, 2022 | Submit to DWQ an annual report relating to its phosphorus discharges as detailed in the TBPEL Variance. (Completed) |
| July 1, 2023 | Submit to DWQ an annual report relating to its phosphorus discharges as detailed in the TBPEL Variance. (Completed) |
| July 1, 2024 | Submit to DWQ an annual report relating to its phosphorus discharges as detailed in the TBPEL Variance. |
| | |

| July 1, 2025 | Submit to DWQ an annual report relating to its phosphorus discharges as detailed in the TBPEL Variance. |
|------------------|---|
| July 1, 2026 | Submit to DWQ an annual report relating to its phosphorus discharges as detailed in the TBPEL Variance. |
| January 1, 2027 | Complete facility construction commissioning and start-up. |
| January 1, 2027 | Comply with all permit effluent limits and conditions. |
| February 1, 2027 | Submit to DWQ the final annual report relating to its phosphorus discharges as detailed in the TBPEL Variance. This report will include a summary of the project. |

When facility upgrades are complete and the increased flow limit goes in effect, Payson will be starting fresh with regards to WET compliance. Following the DWQ WET Guidance Policy that was updated and approved in 2018, the facility will be treated like they are a new discharger. They policy requires that a Major POTW with a design flow less than 20 MGD, sample quarterly and analysis both species for chronic WET. This requirement will not go into effect until the end of the facility upgrades and the compliance schedule.

DISCHARGE

DESCRIPTION OF DISCHARGE

Payson discharges into an irrigation ditch which runs approximately one to two miles before entering Beer Creek. Beer Creek runs through Benjamin Slough and hence to Utah Lake. Payson has been reporting self-monitoring results on Discharge Monitoring Reports on a monthly basis. A summary of the last 3 years of data is included in Attachment 2.

| <u>Outfall</u> | <u>Description of Discharge Point</u> |
|----------------|--|
| 001 | Located at latitude 40°03'41" and longitude 111°43'49". The discharge is through a concrete pipe to an unnamed irrigation return drainage ditch to Beer Creek then Benjamin Slough to Utah Lake. |
| <u>Outfall</u> | Description of Reuse Water Discharge Point |
| 001R | Located at latitude 40°03'41" and longitude 111°43'49". The Type II Reuse discharge is to a tank that collects water then sends it to the Payson Power Plant (Nebo Power Station) for use as makeup water in the cooling system. |

RECEIVING WATERS AND STREAM CLASSIFICATION

The final discharge flows into an unnamed ditch hence to Beer Creek. The route that the effluent takes has been classified as 2B & 3C (Beer Creek) and 4 (unnamed ditch and Beer Creek) according to *Utah Administrative Code (UAC) R317-2-13*.

Class 2B -- Protected for infrequent primary contact recreation. Also protected for secondary contact recreation where there is a low likelihood of ingestion of water or a low degree of bodily

contact with the water. Examples include, but are not limited to, wading, hunting, and fishing.

- Class 3C -- Protected for nongame fish and other aquatic life, including the necessary aquatic organisms in their food chain.
- Class 4 -- Protected for agricultural uses including irrigation of crops and stock watering.

TOTAL MAXIMUM DAILY LOAD (TMDL) REQUIREMENTS

Beer Creek and tributaries from confluence with Spring Creek to headwaters (UT16020202-027_00) is listed as impaired for E. coli and O/E bioassessment according to the 303(d) list in the Utah's Final 2021 Integrated Report (UDWQ 2021). Benjamin Slough from confluence with Utah Lake to Beer Creek confluence is listed as impaired for total ammonia. Utah Lake other than Provo Bay (UT-L-16020201-004_01) is listed as impaired for E. coli, Harmful Algal Blooms (HABs), Eutrophication, PCBs in Fish Tissue, Phosphorus; and Total Dissolved Solids (TDS).

Reasonable Potential Analysis

Since January 1, 2016, DWQ has conducted reasonable potential analysis (RP) on all new and renewal applications received after that date. RP for this permit renewal was conducted following DWQ's September 10, 2015 Reasonable Potential Analysis Guidance (RP Guidance). There are four outcomes defined in the RP Guidance: Outcome A, B, C, or D. These Outcomes provide a frame work for what routine monitoring or effluent limitations are required

A screening of heavy metals monitoring results reported in the DMRs was conducted. The screening process is a check to see if the highest value received on any monitored parameter is greater than half the Acute or Chronic WQBEL from the WLA. The screening resulted in a need for a full RP Analysis to be run on the monitoring data for mercury, selenium, free cyanide, and total cyanide.

A quantitative RP analysis was performed on cyanide, selenium and mercury to determine if there was reasonable potential for the discharge to exceed the applicable water quality standards. Based on the RP analysis, the limits for the renewal permit will remain in the permit until the facility upgrades are completed and the next permit renewal. A copy of the RP analysis is included at the end of this Fact Sheet.

BASIS FOR EFFLUENT LIMITATIONS

Attached is a Wasteload Analysis for this discharge into the unnamed irrigation return ditch to Beer Creek then Benjamin Slough to Utah Lake. It has been determined that this discharge will not cause a violation of water quality standards. An L2ADR review is required since the renewal is an expansion and modification of an existing treatment works. The L2ADR was provided as part of the renal application. The total suspended solids (TSS), biochemical oxygen demand (BOD5), *E. coli*, pH and percent removal for BOD5 and TSS are based on current Utah Secondary Treatment Standards, UAC R317-1-3.2. The oil and grease is based on best professional judgment (BPJ). The inclusion of effluent limits for cyanide, mercury and selenium are based on RP and the remaining effluent limits are based on the WLA. The inclusion of effluent limits for ammonia and TRC are based on the effluent makeup and treatment process in place, and the effluent limits are based on the WLA. The inclusion of WET is based on the WET Policy.

The permit limitations are;

SELF-MONITORING AND REPORTING REQUIREMENTS

The following self-monitoring requirements are the similar to the previous permit. The changes were noted earlier in the FSSPOB under the Changes from The Previous Permit section. The permit will require Discharge Monitoring Reports (DMRs) to be submitted monthly, quarterly, and annually, as applicable, due 28 days after the end of the monitoring period. Monitoring results must be submitted using NetDMR unless the permittee has successfully petitioned for an exception. Lab sheets for biomonitoring must be attached to the biomonitoring DMR. Lab sheets for metals and toxic organics must be attached to the DMRs.

BIOSOLIDS

For clarification purposes, sewage sludge is considered solids, until treatment or testing shows that the solids are safe, and meet beneficial use standards. After the solids are tested or treated, the solids are then known as biosolids. Class A biosolids, may be used for high public contact sites, such as home lawns and gardens, parks, or playing fields, etc. Class B biosolids may be used for low public contact sites, such as farms, rangeland, or reclamation sites, etc.

DESCRIPTION OF TREATMENT AND DISPOSAL

The Permittee submitted their 2022 annual biosolids report on February 7, 2023. The report states the Permittee produced 257 dry metric tons (DMT) of solids. Payson's average annual biosolids production rate over the past 10 years has been 312 dry metric tons (DMT) of solids.

The biosolids (sewage sludge) are stabilized in anaerobic digesters with a hydraulic retention time of 40 days at an average temperature of 95°F (35°C). Once a week the biosolids are drawn off the bottom of the primary digester and sent to the secondary digester that serves as a holding tank. The biosolids from the secondary digester are wasted to a screw press, and then hauled to the drying beds for holding until they are then hauled to Payson City Landfill.

Payson City has nine (9) drying beds. The first five drying beds have an area of 5000 ft² each. The remaining four drying beds have a combined area of 16,150 ft². The biosolids are removed from the drying beds and sent to land fill.

The last inspection conducted at the land application site was September 1, 2022. The inspection showed that Payson was in compliance with all aspects of the biosolids management program.

SELF-MONITORING REQUIREMENTS

Under 40 CFR 503.16(a)(1), the self-monitoring requirements are based upon the amount of biosolids disposed per year and shall be monitored according to the chart below.

^{19.} Reuse monitoring results obtained during the previous month for reuse discharges shall be summarized for each month and reported on a Monthly Operational Report, post-marked no later than the 28th day of the month following the completed reporting period.

| Minimum Frequency of Monitoring (40 CFR Part 503.16, 503.26. and 503.46) | | | | | | |
|--|---------------------|------------------------------|--|--|--|--|
| Amount of Biosolid | s Disposed Per Year | Monitoring Frequency | | | | |
| Dry US Tons | Dry Metric Tons | Per Year or Batch | | | | |
| > 0 to < 320 | > 0 to < 290 | Once Per Year or Batch | | | | |
| > 320 to < 1650 | > 290 to < 1,500 | Once a Quarter or Four Times | | | | |
| > 1,650 to < 16,500 | > 1,500 to < 15,000 | Bi-Monthly or Six Times | | | | |
| > 16,500 | > 15,000 | Monthly or Twelve Times | | | | |

Over the past 10 years Payson has produced on average 312 DMT of biosolids annually, therefore they need to sample at least four times a year.

Landfill Monitoring

Under 40 CFR 258, the landfill monitoring requirements include a paint filter test. If the biosolids do not pass a paint filter test, the biosolids cannot be disposed in the sanitary landfill (40 CFR 258.28(c)(1).

BIOSOLIDS LIMITATIONS

Heavy Metals

Class A Biosolids for Home Lawn and Garden Use

The intent of the heavy metals regulations of Table 3, 40 CFR 503.13 is to ensure the heavy metals do not build up in the soil in home lawn and gardens to the point where the heavy metals become phytotoxic to plants. The permittee will be required to produce an information sheet (see Part III. C. of the permit) to made available to all people who are receiving and land applying Class A biosolids to their lawns and gardens. If the instructions of the information sheet are followed to any reasonable degree, the Class A biosolids will be able to be land applied year after year, to the same lawns and garden plots without any deleterious effects to the environment. The information sheet must be provided to the public, because the permittee is not required, nor able to track the quantity of Class A biosolids that are land applied to home lawns and gardens.

Class A Requirements With Regards to Heavy Metals

If the biosolids are to be applied to a lawn or home garden, the biosolids shall not exceed the maximum heavy metals in Table 3 below. If the biosolids do not meet these requirements, the biosolids cannot be sold or given away for applications to home lawns and gardens.

Class B Requirements for Agriculture and Reclamation Sites

The intent of the heavy metals regulations of Tables 1, 2 and 3, of 40 CFR 503.13 is to ensure that heavy metals do not build up in the soil at farms, forest land, and land reclamation sites to the point where the heavy metals become phytotoxic to plants. The permittee will be required to produce an information sheet (see Part III. C. of the permit) to be handed out to all people who are receiving and land applying Class B biosolids to farms, ranches, and land reclamation sites (if biosolids are only applied to land owned by the permittee, the information sheet requirements are waived). If the biosolids are land applied according to the regulations of 40 CFR 503.13, to any reasonable degree, the Class B biosolids will be able to be land applied year after year, to the same farms, ranches, and land reclamation sites without any deleterious effects to the environment.

Class B Requirements With Regards to Heavy Metals

If the biosolids are to be land applied to agricultural land, forest land, a public contact site or a reclamation site it must meet at all times:

The maximum heavy metals listed in 40 CFR Part 503.13(b) Table 1 and the heavy metals loading rates in 40 CFR Part 503.13(b) Table 2; or

The maximum heavy metals in 40 CFR Part 503.13(b) Table 1 and the monthly heavy metals concentrations in 40 CFR Part 503.13(b) Table 3.

Tables 1, 2, and 3 of Heavy Metal Limitations

| Pollutant Limits, (40 CFR Part 503.13(b)) Dry Mass Basis | | | | | | | | |
|--|--|------------------------------|--|---------------------------------|--|--|--|--|
| Heavy Metals | Table 1 | Table 2 | Table 3 | Table 4 | | | | |
| | Ceiling Conc. Limits ²⁸ , (mg/kg) | CPLR ²⁹ , (mg/ha) | Pollutant Conc. Limits ³⁰ (mg/kg) | APLR ³¹ , (mg/ha-yr) | | | | |
| Total Arsenic | 75 | 41 | 41 | 2.0 | | | | |
| Total Cadmium | 85 | 39 | 39 | 1.9 | | | | |
| Total Copper | 4300 | 1500 | 1500 | 75 | | | | |
| Total Lead | 840 | 300 | 300 | 15 | | | | |
| Total Mercury | 57 | 17 | 17 | 0.85 | | | | |
| Total Molybdenum | 75 | N/A | N/A | N/A | | | | |
| Total Nickel | 420 | 420 | 420 | 21 | | | | |
| Total Selenium | 100 | 100 | 100 | 5.0 | | | | |
| Total Zinc | 7500 | 2800 | 2800 | 140 | | | | |

- 1. If the concentration of any 1 (one) of these parameters exceeds the Table 1 limit, the biosolids cannot be land applied or beneficially used in any way.
- 2. CPLR Cumulative Pollutant Loading Rate The maximum loading for any 1 (one) of the parameters listed that may be applied to land when biosolids are land applied or beneficially used on agricultural, forestry, or a reclamation site.
- 3. If the concentration of any 1 (one) of these parameters exceeds the Table 3 limit, the biosolids cannot be land applied or beneficially used in on a lawn, home garden, or other high potential public contact site. If any 1 (one) of these parameters exceeds the Table 3 limit, the biosolids may be land applied or beneficially reused on an agricultural, forestry, reclamation site, or other high potential public contact site, as long as it meets the requirements of Table 1, Table 2, and Table 4.
- 4. APLR Annual Pollutant Loading Rate The maximum annual loading for any 1 (one) of the parameters listed that may be applied to land when biosolids are land applied or beneficially reused on agricultural, forestry, or a reclamation site, when they do not meet Table 3, but do meet Table 1.

Any violation of these limitations shall be reported in accordance with the requirements of Part III.F.1. of the permit .If the biosolids do not meet these requirements they cannot be land applied.

Pathogens

The Pathogen Control class listed in the table below must be met;

| Pathogen C | ontrol Class |
|---|--|
| 503.32 (a)(1) - (5), (7), (8), Class A | 503.32 (b)(1) - (5), Class B |
| B Salmonella species –less than three (3) | Fecal Coliforms – less than 2,000,000 MPN or |
| MPN ³² per four (4) grams total solids (DWB) ³³ | CFU ³⁴ per gram total solids (DWB). |
| or Fecal Coliforms – less than 1,000 MPN per | |
| gram total solids (DWB). | |
| 503.32 (a)(6) Class A—Alternative 4 | |
| B Salmonella species –less than three (3) MPN | |
| per four (4) grams total solids (DWB) or less | |
| than 1,000 MPN Fecal Coliforms per gram total | |
| solids (DWB), | |
| And - Enteric viruses –less than one (1) plaque | |
| forming unit per four (4) grams total solids | |
| (DWB) | |
| And - Viable helminth ova –less than one (1) | |
| per four (4) grams total solids (DWB) 5. MPN – Most Probable Number. | |
| | |
| 6. DWB – Dry Weight Basis. | |
| 7. CFU – Colony Forming Units. | |

Class A Requirements for Home Lawn and Garden Use

If biosolids are land applied to home lawns and gardens, the biosolids need to be treated by a specific process to further reduce pathogens (PFRP), and meet a microbiological limit of less than less than 3 most probable number (MPN) of *Salmonella* per 4 grams of total solids (or less than 1,000 most probable number (MPN/g) of fecal coliform per gram of total solids) to be considered Class A biosolids.

At this time Payson does not intend to distribute biosolids to the public for use on the lawn and garden and thus is not currently required to meet Class A Biosolids requirements.

The practice of sale or giveaway to the public is an acceptable use of biosolids of this quality as long as the biosolids continue to meet Class A standards with respect to pathogens. If the biosolids do not meet Class A pathogen standards the biosolids cannot be sold or given away to the public, and the permittee will need find another method of beneficial use or disposal.

Pathogens Class B

If biosolids are to be land applied for agriculture or land reclamation the solids need to be treated by a specific process to significantly reduce pathogens (PSRP

At this time Payson does not intend to distribute bulk biosolids for land application and thus is currently not required meet Class B Biosolids requirements.

Vector Attraction Reduction (VAR)

If the biosolids are land applied Payson will be required to meet VAR through the use of a method of listed under 40 CFR 503.33. At this time Payson does not intend to distribute biosolids to the public for beneficial use, and will be disposing of them in a landfill. Under 40 CFR 503.33(b)(11)

If the biosolids do not meet a method of VAR, the biosolids cannot be land applied.

If the permittee intends to use another one of the listed alternatives in 40 CFR 503.33, the Director and the

EPA must be informed at least thirty (30) days prior to its use. This change may be made without additional public notice

Landfill Monitoring

Under 40 CFR 258, the landfill monitoring requirements include a paint filter test to determine if the biosolids exhibit free liquid. If the biosolids do not pass a paint filter test, the biosolids cannot be disposed in the sanitary landfill (40 CFR 258.28(c)(1).

Record Keeping

The record keeping requirements from 40 CFR 503.17 are included under Part III.G. of the permit. The amount of time the records must be maintained are dependent on the quality of the biosolids in regards to the metals concentrations. If the biosolids continue to meet the metals limits of Table 3 of 40 CFR 503.13, and are sold or given away the records must be retained for a minimum of five years. If the biosolids are disposed in a landfill the records must retained for a minimum of five years.

Reporting

Payson must report annually as required in 40 CFR 503.18. This report is to include the results of all monitoring performed in accordance with Part III.B of the permit, information on management practices, biosolids treatment, and certifications. This report is due no later than February 19 of each year. Each report is for the previous calendar year.

MONITORING DATA

Monitoring Data

Payson disposed of all biosolids at the Payson City Landfill. Therefore, they were not required to sample metals or pathogens.

STORM WATER

Separate storm water permits may be required based on the types of activities occurring on site.

Permit coverage under the Multi Sector General Permit (MSGP) for Storm Water Discharges from Industrial Activities is required based on the Standard Industrial Classification (SIC) code for the facility and the types of industrial activities occurring. If the facility is not already covered, it has 30 days from when this permit is issued to submit the appropriate Notice of Intent (NOI) for the MSGP or exclusion documentation. Previously storm water discharge requirements and coverage were combined in this individual permit. These have been separated to provide consistency among permittees, electronic reporting for storm water discharge monitoring reports, and increase flexibility to changing site conditions.

Information on storm water permit requirements can be found at http://stormwater.utah.gov

PRETREATMENT REQUIREMENTS

Payson will continue to administer an Approved POTW Pretreatment Program (Program). Any changes to the Program must be submitted for approval to the Division of Water Quality (DWQ) before implementing the change, 40 CFR 403.18. Authority to require a Program is provided for in 19-5-108 UCA, 1953 ann. and UAC R317-8-8.

The Pretreatment Requirements in Part II of the UPDES Permit were modified to add additional language

to clarify requirements. The changes are consistent with 40 CFR 122, UAC R317 and 40 CFR 403.

Metals must be sampled quarterly, and organic toxics yearly; see Part II of the UPDES Permit. The permit requires influent and effluent monitoring for metals and organic toxics. As stated in the permit, the most sensitive method should be used for analyzing pollutants of concern as determined by the local limit development. The monitoring frequency is consistent with the UPDES Pretreatment Guidance for Sampling of POTWs, which is based on the design flow of the wastewater treatment plant. Payson must submit the analysis for the TTO, via email, to the Pretreatment Coordinator for DWQ.

Additional requirements have been added to the permit regarding local limits. This includes notifying the Pretreatment Coordinator for DWQ of issues related to pollutants of concern. This is to ensure that local limits are protecting the POTW or that further investigation is occurring by the permittee.

Payson has developed technically based local limit. The permit requires an annual evaluation of the local limit to determine the need to revise or develop technically based local limits to implement the general and specific prohibitions of 40 CFR, Part 403.5(a) and Part 403.5(b). This evaluation may indicate that present local limits are sufficiently protective or must be revised. The initial evaluation is due twelve months after the effective date of the permit. Payson should utilize the EPA Local Limits Development Guidance to justify re-evaluating the local limits. Information is provided in Chapter 7 of the EPA Local Limits Development Guidance 2004 to assist with revising the local limits. Also, DWQ has a template for submitting the evaluation of the local limits.

BIOMONITORING REQUIREMENTS

A nationwide effort to control toxic discharges where effluent toxicity is an existing or potential concern is regulated in accordance with the State of Utah Permitting and Enforcement Guidance Document for Whole Effluent Toxicity Control (biomonitoring). Authority to require effluent biomonitoring is provided in Permit Conditions, UAC R317-8-4.2, Permit Provisions, UAC R317-8-5.3 and Water Quality Standards, UAC R317-2-5 and R317 -2-7.2.

The permittee is a major municipal facility with a pretreatment program with a dilution ratio that is less than 20:1, and a flow less than 20 MGD therefore according to new WET Guidance Payson is required to conduct Quarterly chronic WET testing. The permit will contain a toxicity limitation re-opener provision that allows for modification of the permit should additional information indicate the presence of toxicity in the discharge.

PERMIT DURATION

It is recommended that this permit be effective for a duration of five (5) years.

PUBLIC NOTICE

Began: Month Day, Year Ended: Month Day, Year

Comments will be received at: 195 North 1950 West

PO Box 144870

Salt Lake City, UT 84114-4870

The Public Noticed of the draft permit was published on the Division of Water Quality Public Notice Webpage.

During the public comment period provided under R317-8-6.5, any interested person may submit written comments on the draft permit and may request a public hearing, if no hearing has already been scheduled. A request for a public hearing shall be in writing and shall state the nature of the issues proposed to be raised in the hearing. All comments will be considered in making the final decision and shall be answered as provided in R317-8-6.12.

ADDENDUM TO FSSOB

During finalization of the Permit certain dates, spelling edits and minor language corrections were completed. Due to the nature of these changes they were not considered Major and the permit is not required to be re Public Noticed.

Responsiveness Summary

(Explain any comments received and response sent. Actual letters can be referenced, but not required to be included).

Reasonable Potential Analysis

REASONABLE POTENTIAL ANALYSIS

Water Quality has worked to improve our reasonable potential analysis (RP) for the inclusion of limits for parameters in the permit by using an EPA provided model. As a result of the model, more parameters may be included in the renewal permit. A Copy of the Reasonable Potential Analysis Guidance (RP Guide) is available at water Quality. There are four outcomes for the RP Analysis¹. They are;

Outcome A: A new effluent limitation will be placed in the permit.

Outcome B: No new effluent limitation. Routine monitoring requirements will be placed or increased from what

they are in the permit,

Outcome C: No new effluent limitation. Routine monitoring requirements maintained as they are in the permit,

Outcome D: No limitation or routine monitoring requirements are in the permit.

Initial screening for metals values that were submitted through the discharge monitoring reports showed that a closer look at some of the metals is needed. A copy of the initial screening is included in the "Effluent Metals and RP Screening Results" table in this attachment. The initial screening check for metals showed that the full model needed to be run on mercury, selenium, free cyanide, and total cyanide.

Mercury RP Analysis

The RP model was run on mercury using the most recent data back through September 2018. This resulted in 50 data points to use for the run. The data was entered into ProUCL to check the goodness of fit of the data (GOF) and determine the distribution of the data. The data did not follow a discernible distribution at (0.05) Level of Significance, so the Default distribution was used. No check for outliers was conducted. The result of the model run is that there is a RP for the effluent to exceed the Chronic WQBEL of 0.000013 mg/L but not RP for the Acute WQBEL of 0.0016 mg/L at both the 95th and 99th percentile confidence interval. This result is the same as last renewal, and the limit will remain in the permit.

(Outcome A from Reasonable Potential Guide)

Selenium RP Analysis

The RP model was run on selenium using the most recent data back through September 2018. This resulted in 52 data points to use for the run. The data was entered into ProUCL to check the goodness of fit of the data (GOF) and determine the distribution of the data. At a 0.5 significance level, the data was not Normal (Normal Distribution), but did appear to be Gamma Distribution and Lognormal Distribution. The Lognormal distribution was used. No check for outliers was conducted. The result of the model run is that there is a RP for the effluent to exceed the Chronic WQBEL of 0.0055 mg/L at the at the 95th percentile confidence interval, and no RP for the Acute WQBEL of 0.0121 mg/L at both the 95th and 99th percentile confidence interval. This result is similar to the last renewal, but the RP for the Acute WQBEL has disappeared. For this renewal the limit and monitoring requirements will remain, and the RP can be repeated at the next Renewal.

(Outcome A from Reasonable Potential Guide)

Cyanide RP Analysis

The RP model was run on cyanide using the most recent data back through September 2018. This resulted in 91 data points for total cyanide (TCN) and 96 data points for free cyanide (FCN) to use for the analysis. The data was entered into ProUCL to check the goodness of fit of the data (GOF) and determine the distribution of the data. At a 0.5 significance level, the data did not appear to be Gamma or Lognormal Distributed, but did appear to be Normal Distributed. The Normal distribution was used. The lab reports for the data were all provided and did not indicate any issues with the cyanide results, so no check for outliers was conducted.

¹ See Reasonable Potential Analysis Guidance for definitions of terms

Since the lab reports for the monitoring were provided the sample date, result, method detection level (MDL), and method reporting level (MRL) were all able to be entered into a spread sheet for comparison. On most days a sample for free and total cyanide were collected. The majority of the FCN data was reported as below the MRL and/or the MDL. Only a few samples of TCN were reported as below the MRL or MDL, and a few were reported as below the actual value of the MDL (<0.0005 mg/L). For both free and total cyanide, the earlier data was usually below the MRL which was higher than the MDL, and by April of 2023 the laboratory has improved their methodology for FCN analysis that the MRL and MDL have lowered enough for actual results to be indicated.

FCN is a subset of the TCN in a sample. By arranging the data chronologically, it could be compared in such a way that if the FCN was reported as below MRL or MDL, which was higher that the value reported for TCN, the TCN value could be substituted. The RP model uses a non-detect indicator of ND and interprets it as whatever value was included as the reporting limit. One may also swap out the ND for the actual MRL or MDL. This results in multiple scenarios to run for both FCN and TCN. For both FCN and TCN the model can be run at the 95th and 99th percentile confidence interval with the ND in place and the reporting limit values as the MDL and then MRL. They can also be run with the values for the MDL or MRL substituted in place of the ND indicator. Lastly, for FCN you can also run the model using the lowest valid number. This is determined by comparing the indicator on each sample.

The rules for determining the value are

The TCN result used for comparison is what is indicated in the TCN report. It would be the actual value, or if it was indicated as below the MRL or MDL, the corresponding limit would be used.

The FCN result used for comparison is what is indicated in the FCN report. It would be the actual value, or if it was indicated as below the MRL or MDL, the corresponding limit would be used

The FCN result would be compared to the TCN result for the same days sample.

If there was no TCN sample that corresponded with an FCN sample, then the FCN value was used.

If the TCN value was above the FCN value, then the FCN value was used,

If the TCN value was below the FCN Value, then the TCN was used.

If there was no FCN sample that corresponded with a TCN sample, then no sample would be used.

This comparison resulted in a rationalized best value to be compared.

In all there are is 6 TCN scenarios and 8 FCN scenarios to run.

They were all run and the inputs, settings and results are all summarized in the tables below.

The result of the model runs is that there is RP for the effluent to exceed the TCN Acute WQBEL of 0.0143 mg/L and Chronic WQBEL of 0.0057 mg/L.

The result of the model runs is that there is no RP for the effluent to exceed the FCN Acute WQBEL of 0.0143 mg/L at the at the 95th percentile confidence interval, but there is at the 99th percentile confidence interval, and there is RP for the FCN Chronic WOBEL of 0.0057 mg/L.

For this renewal the limits will remain in place, and be adjusted at the end of the Compliance Schedule.

Over the previous permit cycle there have been several violations of the Chronic WQBEL for TCN, and would have been violations of the Acute WQBEL for TCN if it had been implemented during the previous permit renewal.

| Cyanide Monthly N | Max Average Effluer | nt Violations | |
|-------------------|---------------------|----------------|---------------|
| Monitoring | Effluent | Reported Value | % Exceedance |
| Period End Date | Limitation | Reported value | 70 Exceedance |
| 04/30/2019 | 0.0067 mg/L | 0.008 mg/L | 19% |

| 01/31/2022 | 0.0067 mg/L | 0.007 mg/L | 4% |
| 03/31/2022 | 0.0067 mg/L | 0.011 mg/L | 64% |
| 05/31/2022 | 0.0067 mg/L | 0.012 mg/L | 79% |
| 06/30/2022 | 0.0067 mg/L | 0.007 mg/L | 9% |
| 07/31/2022 | 0.0067 mg/L | 0.0133 mg/L | 99% |
| 08/31/2022 | 0.0067 mg/L | 0.0096 mg/L | 43% |
| 10/31/2022 | 0.0067 mg/L | 0.0071 mg/L | 6% |
| 11/30/2022 | 0.0067 mg/L | 0.0078 mg/L | 16% |
| 01/31/2023 | 0.0067 mg/L | 0.0092 mg/L | 37% |
| 02/28/2023 | 0.0067 mg/L | 0.0084 mg/L | 25% |
| 05/31/2023 | 0.0067 mg/L | 0.0079 mg/L | 29% |
| 07/31/2023 | 0.0067 mg/L | 0.0075 mg/L | 12% |

As a result, there will be an increase in the monitoring frequency for both TCN and FCN to attempt to develop a better understanding of the Effluent TCN and FCN concentrations. The monitoring requirements will be changed to include the requirement of FCN Sampling, and increase the monitoring frequency to twice a month for both.

(Outcome A from Reasonable Potential Guide)

The RP can be run at the next renewal and if the conditions merit it, the limits for included as a result of the RP could be removed. The facility is in the early stages of an upgrade and the new treatment process may reduce some of these pollutants, and eliminate the RP. With the lab methodology improvements, improved treatment, the facility upgrades, and the continued aggressive monitoring of FCN and TCN for the next renewal could result in an indication of No RP for cyanide, and the other metals, which could be grounds to justify removal of the limits at that time.

A Summary of the RP Model inputs and outputs are included in the table below.

The Metals Initial Screening Table and RP Outputs Table are included in this attachment.
